Coal Authority Report

1 Introduction

W.D. Huddersfield Limited (WDHL) propose to develop an area of land located immediately north of the existing Kingsgate Centre, Huddersfield, Figure 1. The development will comprise a two storey extension to the existing Kingsgate shopping centre with under croft parking. The site area is shown in Figure 2.

Arup was commissioned by WDHL to undertake a Geo-Environmental Desk Study for the site. The aim of the study was to determine the prevailing ground conditions and identify any potential ground related constraints, including those related to potential contamination, which may impact on the proposed development.

The desk study comprised a review of readily available information on the history, ground conditions and the environmental setting of the site.

This report summarises the findings of the desk study and presents a preliminary contamination risk assessment, together with a summary of the ground related engineering considerations for the proposed development. It also makes recommendations for future work.

This report takes into account the specific instructions and requirements of WDHL. It is not intended for and should not be relied on by any third party and no responsibility is undertaken to any third party.

2 The Site

2.1 Site Location

The site is located in Huddersfield town centre, immediately to the north of the existing Kingsgate shopping centre, Figure 1. The site is centred about an approximate National Grid Reference SE 146 166.

The site is bounded to the north by a student accommodation block, to the west by Venn Street, to the east by Oldgate House and to the south by the Kingsgate shopping centre, Figure 2.

2.2 Site Description

The following site description is based upon a review of readily available maps, Goad Insurance Plans, aerial photographs and Google street view [1].

The site is approximately square in shape and covers 0.13 hectares, approximately 90m long in a north-south direction, and up to 100m wide in an east-west direction, Figure 2.

Site levels generally fall west to east across the site and are indicated to range from approximately 83mOD on Cross Church Street to the east to 75mOD to the west on Oldgate.

The site is currently occupied by a road and areas of tarmacadam hardstanding used as a car park, bound by railings and brick walls. In the south of the site, Venn Street splits into two ramps which allow access to the basements of the adjacent Kingsgate shopping centre.

A large four storey masonry building, formerly a cinema and night club, is present to the north of the site. This is currently under renovation and will become student accommodation. A multi-storey office block is present to the east of the site, Oldgate House. This is due for demolition. Kingsgate shopping centre is located to the south of the site.

The site immediately to the west is currently used as a car park, and is also under consideration for development as a leisure extension to the existing Kingsgate shopping centre.

2.3 Proposed Development

The proposed development will comprise a two storey extension to the existing Kingsgate shopping centre. The extension will connect to the existing building at mall level and upper trading levels with under croft parking. The full area of the development will be hard paved.

3 Site History

The site history has been determined through a review of historical maps and Goad Insurance Plans contained in an Envirocheck Report [2] obtained for the site, Appendix A, and a previous desk study carried out for the site [3].

The historical maps obtained covered scales at 1:1250, 1:2500, 1:10000 and 1:10560 scales and are dated between 1854 and 2006.

The site is indicated to have been developed and in commercial use prior to the mid nineteenth century, the date of the earliest available maps. The south of the site has been occupied by a school, later converted to "Parish House" from the late nineteenth to the mid twentieth century. The north of the site has been occupied by a carriage works, steel and iron store, smithy and a warehouse.

The areas surrounding the site are shown to have been predominantly occupied by shops residential properties, public houses, small works and a yard since the mid nineteenth century to the present day.

Basements and a sunken fuel tank are indicated to have been present locally. A sunken fuel tank adjacent to the site is understood to have been removed during the construction of the Kingsgate shopping centre.

The large five storey masonry building to the north of the site was once used as a theatre and is indicated by the Goad Insurance Plans to have contained asbestos in the past.

Further details of the site history are summarised in Table 3.1.

Table 3.1 – Summary of Site History

Map Date(s)	Scale	The site	Adjacent Areas
1854	1:10,560	The site is shown to have been developed by this time, although details of land uses are unknown.	Areas immediately adjacent to the site are shown to be developed.
1893-1894	Goad Insurance Plans and 1:2,500 1:10,560	The Bottomleys Carriage Works is shown in the north of the site. The works includes a showroom, a body and paint shop, tyre furnace, a wheel wright, an iron and lumber yard and a smithy. Two storey stables and lofts are shown in the east of the site. The Kirkgate Iron Store is shown in the centre and east of the site. Two small single story buildings are shown in the south east of the site. A two storey school is shown to intersect the south of the site.	A brewery is shown approximately 50m to the south of the site. The brewery is shown to include a fermenting house, cooling house, bottling store, wash house and warehouses. A church and graveyard are shown 100m north west of the site. Small two to three storey commercial buildings, with localised basements are shown approximately 50m east and west of the site. These buildings are shown to have a range of uses including shops, stables public houses, confectionary, pawnbrokers, surgical appliances shop and a gunshop.

1907	1:2,500 1:10,560	The Bottomleys Carriage Works is no longer shown on the site. The Kirkgate Iron Store has expanded onto the former carriage works, towards the east of the site.	No significant changes are shown adjacent to site.
1918	1:2,500	The Kirkgate Iron Store not shown on site.	No significant changes are shown adjacent to the site.
1930	1:10,560	No significant changes are shown to site.	No significant changes are shown adjacent to the site.
1938	1:10,560	No significant changes are shown to site.	No significant changes are shown adjacent to the site.
1942	Goad Insurance Plans	The Kirkgate Iron Store is now shown as the Kirkgate Iron Warehouse. The site is shown to comprise a van shed, stables and a travelling crane. Van sheds and stables occupy the north of the site The school to the southeast of the site is now shown as a Parish Church School.	The theatre to the north is shown to be five storeys. It is also indicated to contain asbestos. A large two storey building is shown adjacent to the north east of the site. This is shown to be the Empress Billiards Hall. A garage, butchers and warehouses are shown within 50m east of the site. The brewery to the south west of the site is no longer shown. A large yard, bottling stores and drapery are shown in its place.
1948	1:10560	No significant changes are shown to site.	No significant changes are shown adjacent to the site.
1956	1:10560	No significant changes are shown to site.	No significant changes are shown adjacent to the site.
1960	1:2,500	The School is shown to be ‘St. Peters Parish Church Day School’.	A works is shown immediately to the southwest of the site. The billiards hall is now shown as a dance hall.
1966	1:1,250 1:10000	The School is shown as “Parish House” The works in the north of the site are now shown as a warehouse.	The theatre to the northeast of the site is now shown as a bingo hall. The dance hall to the west of the site is now shown as a theatre.
1975	1:1,250	The warehouse in the north of the site is no longer shown.	No significant changes are shown to the area adjacent to the site.
1978	1:1,250 1:10,000	No significant changes are shown to site.	No significant changes are shown to site.
1984	1:10,000	No significant changes are shown to site.	No significant changes are shown to site.
1985	1:1,250	No significant changes are shown to site.	A building is now shown within the area of the former works adjacent to the east boundary of the site shown as Oldgate House Council Offices.

1987	1:10,000	No significant changes are shown to site.	No significant changes are shown to site.
1991	1:1,250	The “Parish House” to the southwest of the site is now shown as an arts centre.	An electricity substation is shown approximately 80m north west of the site. The bingo hall to the north of the site is now shown as a club. The works immediately to the southwest of the site are no longer shown.
1993	1:1,250	No significant changes are shown to site.	No significant changes are shown to site.
2006	1:10,000	No significant changes are shown to site.	The Kingsgate Centre is shown immediately to the south of the site. The former dance hall is no longer shown.

4 Geology and Ground Conditions

The anticipated geology and ground conditions at the site have been identified through a review of the published geological information. The following information was reviewed:

- British Geological Survey (BGS) Solid and drift geology of England and Wales, 1:10000 series [4]
- Memoirs of the Geological Survey England and Wales, Explanation of Sheet 77 and Huddersfield [4];
- BGS Lexicon of Geological Units [5];
- Information from a ground investigation carried out in 1998 for the Kingsgate development, immediately to the south of the site [6];
- Information on potential for ground stability hazards provided within the Envirocheck Report [2], Appendix A;
- Coal Authority Interactive Map [7];
- Coal Mining Report for the proposed development site, dated 23rd December 2016, Appendix B [8];
- Arup Review of Mining Instability, 1990 [9].

It is anticipated that the site is underlain by made ground overlying glacial deposits and in turn Lower Coal Measures strata, which comprise an interbedded sequence of sandstones, mudstones, siltstones and coal seams.

The made ground is anticipated to be variable in nature and thickness. It is likely to comprise granular ashy fill and cohesive reworked glacial till associated with past and current development on the site. The glacial deposits are anticipated to comprise predominantly firm to stiff glacial till with the possibility of cobble and boulder beds present above rockhead.

Rockhead has been recorded in the area of the site between approximately 5m to 9m bgl and generally dips to the east. Sandstone overlying mudstone is indicated to be present at rockhead towards the east of the site, mudstones may be present at rockhead in the far west of the site.

Further details of the ground conditions indicated by the various data sources are summarised below.

4.1 Published Geology

The BGS solid and drift maps for the area indicate the site is underlain by Head deposits overlying Middle Band Rock. Middle Band Rock is a part of the Lower Coal Measures bedrock strata. The Lower Coal Measures comprises an interbedded sequence of sandstones, mudstones, siltstones and coal seams.

The Head deposits are indicated to typically comprise clay with rock debris.

The Middle Band rock is indicated to comprise mudstone overlain by sandstone.

Bedrock is indicated to dip towards the east at approximately 4 degrees.

The Soft Bed Coal seam is indicated to be present beneath the site. The seam is shown to subcrop several hundred meters to the south, west and north of the site. The geological map indicates the seam is up to 0.8m thick, however, the geological memoir indicates the seam is typically between 0.3m and 0.6m thick. The geological sequence indicates the seam is the lowest within the Lower Coal Measures strata.

The geological memoirs indicate the Soft Bed Coal to have been extracted during the nineteenth century from shallow workings in the area. A seatearth below the coal seam has also been worked locally, particularly in the Elland area to the north of Huddersfield. Workings are understood to have been encountered within the Soft Bed coal and seat earth approximately 300m to the west of the site at 20m below ground level (bgl).

The Middle Bed Coal seam is shown to subcrop approximately 200m to the east of the site. The geological map indicates the seam is up to 0.6m thick, however, the geological memoir indicates the seam is generally too thin to be worked, typically less than 0.2m thick. It is known, however, to have been worked locally in the district where it is easily accessible from the ground surface.

4.2 Historical Boreholes

No BGS historical boreholes have been identified on the site, however, a ground investigation carried out in 1998 on the Kingsgate development immediately to the south of the site was reviewed. The site works were carried out by Norwest Holts and comprised 17 boreholes, 17 trial pits and 8 dynamic probe holes.

Made ground was encountered across the entire Kingsgate area, the base depth was encountered between 1.2m and 6.6m and varied from 1m to 4.3m thick in the north east, adjacent to the site. These thick made ground deposits may be associated with the school building identified in the site history, and may not continue across the whole site.

The made ground generally comprised clayey sand and gravel, grading to sandy gravelly clay with variable amounts of cobbles and boulders. It typically contained ash with varying amounts of slag, clinker, coal, brick and sandstone. The made ground was often found to be unstable during excavation.

Glacial deposits were encountered to depths of between 5.2m and 8.1mbgl. The glacial deposits were locally absent in boreholes in the north of the Kingsgate site. The glacial deposits generally comprised glacial till with coarse granular deposits. The glacial till comprised firm to stiff, locally soft or very stiff, orange brown and grey sandy clay with some gravel locally.

Bedrock was encountered at depths between 5.2m and 8.1mbgl, with rockhead falling towards the east from approximately 75.5mOD to 67.3mOD. A relatively thin layer of sandstone was often encountered at rockhead, with mudstone and locally coal encountered at rockhead in the southeast of the Kingsgate site.

A thin seam of highly to completely weathered coal, 0.1m to 0.9m thick, was encountered locally in the southeast of the Kingsgate site, at depths of between 7.5m and 10.6m bgl dipping to the east. It is considered that this probably represents the Middle Band Coal. The only other evidence of this coal seam was encountered in the centre of the Kingsgate site, adjacent to the current site, in the form of localised coal fragments near the base of the glacial deposits. Based on this and the depth of excavation works undertaken during the construction of the Kingsgate development, it is considered that the seam may be locally present, having been eroded in the majority of the area.

A second coal seam, 0.2m to 0.55m thick, was encountered beneath the Kingsgate site at depths of between approximately 20m and 23m bgl. This is considered to be the Soft Bed Coal.

No evidence of mine workings were encountered during the ground investigation.

Groundwater monitoring carried out as part of the ground investigation recorded standing groundwater levels within the drift deposits of approximately 3m bgl. The groundwater level in the underlying bedrock was lower, ranging between approximately 4.2m and 9.5m bgl.

No elevated levels of soil gas were recorded during monitoring carried out as part of the ground investigation.

4.3 Potential for Ground Stability Hazards

The Envirocheck Report Appendix A, provides information on potential ground stability risks, including the potential for shrink/swell, collapsible or compressible ground, dissolution features, running sand and landslides.

All of these potential ground stability hazards were identified as a Non Hazard or present and Very Low risk on the site

4.4 Mining Information

4.4.1 Coal Authority

The Coal Authority Interactive Map [7] indicates the site is within a Coal Mining Reporting Area. A Coal Authority Mining Report [8] was obtained for the site as part of the Desk Study, Appendix B.

The Mining Report provides the following information regarding the site:

- Coal Authority records indicate that the site is not in the likely zone of influence of any recorded past, present or currently proposed future underground mining.
- The site is in an area where coal exists at or close to the surface, which may have been worked unrecorded in the past.
- Due to the mining circumstances, the Coal Authority recommend technical advice should be obtained relating to both the investigation of coal and

former coal mines and their treatment should be obtained before beginning work on the site.

- There are no known coal mine entries on, or within 20m of, the site. There may, however, be mine entries in the area of which the Coal Authority have no knowledge.
- Coal Authority records indicate that the site is not within the boundary of any recorded past, present or currently proposed future opencast mining.
- The Coal Authority has not received a damage notice or claim relating to mining subsidence at the site. The site has also not been subject to any remedial works associated with mining hazards. No notices of entitlement to withdraw support or Orders under the Mines (Working Facilities and Support) Acts have been published for the site.
- There are no records of mine gas emissions at the site having required action by the Coal Authority.

4.4.2 Arup Review of Mining Instability

The Arup Review of Mining Instability, 1990, indicates the site to lie within a wider area of known coal mining. This is consistent with the Coal authority Interactive Map Viewer, section 4.4.1. It is not indicated to be within an area known to have undergone any other underground rock, evaporate or metalliferous mining.

4.4.3 Mining Conclusion

The findings of the desk study indicate the potential risk posed to the proposed development from shallow mine workings to be low.

No recorded workings beneath the site have been indicated by information provided the Coal Authority and BGS.

The shallowest coal seam beneath the site is indicated to be the Soft Band Coal which is anticipated to be present at depths of greater than 20m. No evidence of unrecorded workings within the seam was encountered in two boreholes sunk as part of the 1998 ground investigation, on the adjacent Kingsgate development.

It is generally accepted that the potential risk posed to surface developments by shallow mine workings is reduced to an acceptable level when the ratio of rock cover to seam thicknesses is 10 or greater, or workings are at a depth greater than 30m.

Based on the currently available information it is considered that if workings are present locally in the Soft Band Coal seam beneath the site, there should be sufficient rock cover to provide a rock cover to seam thickness ratio of greater than 10.

The Middle Band Coal seam is shown to subcrop approximately 200m to the east of the site. The seam was possibly encountered locally in the southeast of the Kingsgate site and in the form of localised coal fragments near the base of the

made ground in the centre of the Kingsgate centre. Based on this evidence it is considered the Middle Band Coal Seam may be locally present having been eroded in the majority of the area. As a result unrecorded workings are unlikely to be present associated with this seam, however, it may have been worked locally from the surface at shallow depth.

5 Environmental Setting

Information regarding the environmental setting of the site has been obtained from recent maps and the Envirocheck Report, Appendix A. The report includes information regarding potentially sensitive or contaminative land uses, hydrology and hydrogeology, abstraction and discharge consents, pollution incidents and radon risk. The information provided by the report is summarised below.

5.1 Potentially Sensitive Current/Recent Land Uses

None of the following sensitive land uses are indicated to be present within 500m of the site:

- Areas of Adopted Green Belt
- Areas of Unadopted Green Belt
- Areas of Outstanding Natural Beauty
- Forest parks
- Marine Nature Reserves
- National Nature Reserves
- National Parks
- Nitrate Sensitive Areas
- Ramsar Sites
- Special Areas of Conservation
- Special Protection Areas

5.2 Potentially Contaminative Current/Recent Land Uses

The Envirocheck Report provides information on potentially contaminative current and recent land uses through information from regulatory databases and trade directories.

No potentially contaminative current/recent land uses are indicated on the site.

The potentially contaminative land uses identified from this information in the vicinity of the site are summarised below:

- A Chemical Manufacturer, ‘James Robinson Ltd’, is located 200m to the north of the site. The site holds an Integrated Pollution Controls (IPC), a Control of Major Accident Hazards (COMAH) and a Planning Hazardous Substance Consents (PHSC) license. The PHSC relates to the storage of toxic substances.

- Pharmaceutical company, 'Npil Pharmaceuticals Ltd', is located approximately 300m to the northwest of the site. The company holds IPC and Integrated Pollution Prevention and Control (IPPC) licenses. The licenses allows the manufacture and use of organic chemicals within the chemical industry.
- An agrochemical manufacturer, 'Syngenta Ltd', is located approximately 160m northwest to the site. The license allows for hazardous waste disposal of greater than 10Tonne/Day.
- Huddersfield University is located approximately 300m to the southeast of the site. In the past the university has obtained Registered Radioactive Substances licenses. These have since either been revoked, cancelled or superseded.
- Gas companies Transco, Northern Gas and British Gas are located approximately 675m northeast of the site. They hold COMAH, and PHSC licences. These are for liquefied and natural flammable gas.
- Four fuel stations are located within 500m north, east and south of the site. These all hold Local Authority Pollution Prevention and Control Licenses (LAPPC).
- Three dry cleaners are located within 250m of the site. These all hold LAPPC licences.
- Seventeen pollution incidents to Controlled Waters are reported to have accrued within 500m of the site. The majority of these incidences have been categorised as minor pollution events to the Huddersfield Broad Canal or the River Colne. Three significant incidents were reported approximately 400m to the south of the site and related to unknown sewage or effluent entering the River Colne.
- A licensed waste management facility is located approximately 140m to the northwest of the site. The facility is reported to handle household, commercial and industrial waste.
- A registered waste transfer site is located approximately 400m to the southeast of the site. The facility is reported to handle less than 10000 tonnes of waste per year comprising alcohols, aliphatic hydrocarbons, aromatic hydrocarbons esters and solvents.
- Two registered landfill sites are situated 650 and 950m to the north east of the site.
- Three historic landfill sites are located approximately 600-800m to the northeast and east of the site. The landfill is reported to contain inert, industrial and commercial waste.

It is considered that the likelihood of significant contamination migrating to the site from all these sources is low.

5.3 Hydrology and Hydrogeology

The closest surface water course to the site is the Huddersfield Broad Canal, located approximately 250m to the east of the site. The River Colne is located approximately 600m to the east and southeast of the site.

The site is indicated to be underlain by a 'Secondary Undifferentiated' superficial aquifer. This categorisation is applied to cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the

layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.

The site is indicated to be underlain by a 'Secondary A' bedrock aquifer. This categorisation is applied to permeable layers capable of supporting water supplied at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These were generally formerly classified as minor aquifers.

The site is not located within a Source Protection Zone. The closest Source Protection zone is located 1km northwest of the site and is associated with the bottling of drinking water by Britvic.

Three licensed groundwater abstractions are located within 500m of the site. All water produced from the abstractions is used for cooling or industrial uses. Four surface water abstractions are located within 500m of the site. All water is abstracted from the Huddersfield Canal and is used for cooling or industrial use.

Five active discharge consents are located within 500m of the site. These allow cooling water and sewage discharges into the Huddersfield Broad Canal or River Colne.

The site is not indicated to be within an area identified to be at risk of surface, river or coastal flooding.

5.4 Radon Gas

The Envirocheck Report [2] indicates the site to the located in a "lower probability radon area", where less than 1% of homes are at or above action level and states that no radon protection were required. No protective measures with respect to radon gas are therefore likely to be required for the site.

6 Preliminary Contamination Risk Assessment

6.1 Introduction

Ground contamination can present a risk to site development through potential risks to human health, controlled waters and the wider environment, as well as presenting commercial risk and liabilities associated with any requirements for remediation of the site. Ground contamination is regulated through Part 2A of the Environmental Protection Act (1990), planning and various other pieces of legislation relating to water sources and pollution control.

A preliminary qualitative contamination risk assessment has been carried out for the proposed development, based on the findings of the desk study.

The proposed development will comprise a two storey extension to the existing Kingsgate shopping centre. The extension will connect to the existing building at mall level and upper trading levels with under croft parking. The full area of the development will be hard paved.

The risk assessment has been carried out in line with UK guidance adopting the source-pathway-receptor assessment principle based on a conceptual site model developed for the site, as set out below. This approach allows the significance to be assessed of how the contamination may affect human health, the development of the wider environment (the “receptor”), and how the receptors may be exposed to the contamination (the “pathway”). A pathway must exist for the source to present a risk to any given receptor, resulting in a potential “pollutant linkage”. The magnitude of any risk is assessed by considering the vulnerability of the receptor and the possible impact of the source.

In line with the Environment Agency’s CLR 11 document [10], the conceptual model for the site is set out with contamination sources identified as part of the Hazard Identification, section 6.2. The potential receptors and pathways are identified as part of the Hazard Assessment, section 6.3. The potential receptors for unacceptable risks, due to the presence of pollutant linkages, are identified as part of the Risk Estimation, section 6.4, with the acceptability of these risks discussed in the Risk Evaluation, section 6.5.

6.2 Hazard Identification

The desk study has identified the site to have been in commercial use since prior to the mid-nineteenth century. Potentially contaminative land uses on the site have included a cart manufacturer, with tyre furnace and paint shop, an iron store and smithy and is in current use as a car park. Garages, small works and yards have been located in close proximity to the site. An underground tank is indicated to have been present in a garage to the east of the site which may have resulted in some localised contamination. It is understood the tank was removed during the Kingsgate development. A building adjacent to the site is indicated by Goad Insurance Plans to have contained asbestos. This building is currently being

refurbished. Asbestos may also have been present in historic buildings and may still be present in existing buildings adjacent to the site. As a result a degree of asbestos may be locally present on the site associated with the construction and demolition of these buildings.

No current or recent land uses are indicated to be present on or in the immediate vicinity of the site, which are likely to have resulted in significant contamination of the site.

Variable depths of made ground are anticipated to be present on the site. The fill materials are likely to be associated with previous development on the site and are likely to include ash, clinker, slag and coal.

There is the potential that any significant thicknesses of made ground could generate soil gas, however, in light of the indicated nature of the made ground, it is anticipated that volumes and flows of any such gas are likely to be relatively low.

Based on the findings of the Mining Risk Assessment, section 6.4, it is considered that there is low potential for shallow unrecorded mine workings to be present beneath the site and the likelihood of mine gas therefore also considered to be low.

Table 6.1-Summary of Potential Sources of Contamination

Source	Area of the site	Potential Contaminants
Made ground encountered on the site	All areas of the site	The made ground is likely to include ash, clinker, slag and coal. These are likely to have associated levels of contaminants including Heavy Metals, Inorganic Compounds, Hydrocarbons relating to the historical land use. Asbestos may be present due to demolition of nearby buildings. Limited volume and concentrations of soil gas associated with degradation of organic matter.
Car park and former site of Van Shed	All areas of the site	Potential for contaminants to be present associated with localised fuel spillages from machinery, vehicles or tanks.
Former site of carriage works and smithy	North	Potential for localised contaminants including Heavy Metals and Inorganic Compounds associated with previous industrial use.

Based on the findings of the desk study it is considered that the potential for significant contamination to be present on the site is low. The potential does, however, exist for low levels of contamination to be present over areas of the site with localised areas of higher contamination associated with previous commercial/ industrial activities on or near the site.

6.3 Hazard Assessment

It is understood that the Kingsgate Leisure development will comprise the construction of an extension to the existing shopping centre. The two storey extension will include under croft parking for which excavation of made ground is anticiptated.

The nearest surface water course is the Broad Canal. The site is underlain by a Secondary Undifferentiated superficial aquifer and a Secondary-A bedrock aquifer. Several water abstractions are located within 500m of the site, however, these are all associated with cooling and industrial uses.

Based on the nature of the proposed development it is considered that there is a potential for a number of receptors to be exposed to any ground contamination that may be present on site. The potential **receptors** and **exposure pathways** identified as part of the risk assessment are summarised below in Table 6.2.

Table 6.2 – Summary of Potential Receptors and Their Associated Exposure Pathways.

Receptor	Potential Pathways
Construction Worker	Inhalation of dust, gas or vapours, direct dermal contact and ingestion of any contaminated soils, dust or groundwater, particularly during excavations within the made ground.
Site End-Users (Worker and Visitors)	Inhalation of dust, gas or vapours, in any limited areas of soft landscaping the potential for direct dermal contact and ingestion of contaminated soil or dust.
Adjacent Land-Users (Local residents and visitors)	Inhalation of dust and vapours, most notably during construction works and from any areas of soft landscaping after construction. The likelihood of exposure after construction is likely to be significantly lower than that during construction.
Building-Materials	Direct contact with any aggressive contaminants within soil or ground water. This could potentially result in degradation of building materials such as buried concrete.
Water supply pipes	Permeation of any organic contaminants into water supply.
Controlled Waters (Coal Measures Aquifer and the Broad Canal)	Leaching of any mobile soil contaminants, lateral and vertical groundwater migration through drift deposits into underlying aquifer or surface water resources.

6.4 Risk Assessment

The risks posed to each of the identified potential receptors have been assessed through a preliminary qualitative risk assessment. The risks have been estimated in line with the guidance provided in CIRIA Report CC552, “Contaminated Land Risk Assessment – a guide to good practice” [11].

The risk assessment has assumed low levels of widespread contamination, with the potential for localised areas of some more significant contamination and the potential for low flows and concentrations of ground gas.

Table 6.3 summarises the possible source-pathway-receptor relationships and estimates the magnitude and probability of the risk posed, in line with CIRIA C552 [10]. The risks are evaluated in section 6.5.

Table 6.3 – Summary of Preliminary Contamination Risk Assessment

Receptor	Source	Potential Pathway	Consequence of Risk	Probability of Risk	Classification of Risk	Potential Mitigation Measures
Construction Workers	General soil and groundwater contamination associated with made ground	Direct dermal contact with soils or water/ ingestion of soils, dust or water/ inhalation of dust or vapours	Minor	High Likelihood	Moderate/Low Risk	Risks to construction workers should be minimised as a matter of course through adoption of appropriate best practice including adoption of appropriate best practice including adoption of good hygiene person protective equipment, confined spaces, best practice and good site housekeeping.
	Soil gas/vapours	Accumulation in confined spaces – inhalation and explosions	Medium/ Severe	Low Likelihood	Moderate to Moderate/Low Risk	
	Asbestos contamination of soils, if present	Inhalation of dust/fibres	Medium	Likely	Moderate	Appropriate adoption of PPE and site best practice if asbestos is present. Specialist advice to be sought in accordance with CAR 2012.
Site end-user	General soil and groundwater contamination associated with any remaining made ground	Direct dermal contact with soils or water/ ingestion of soils, dust or water/ inhalation of dust or vapours (Assuming limited soft landscaped areas)	Mild	Unlikely	Very Low	If required, risks can be further reduced by removal, capping or treatment of any localised contamination within areas of soft landscaping.
	Soil gas	Accumulation in confined spaces – inhalation and explosions	Medium/ Severe	Unlikely	Moderate/Low Risk	Should investigation identify a potential gas risk, this could be mitigated through implementation of gas protective measures as part of the building design.
	Asbestos contamination of soils, if present	Inhalation of dust/fibres	Medium	Unlikely	Low Risk	Appropriate asbestos strategy to be developed if asbestos is identified to be present. Specialist advice to be sought in accordance with CAR 2012.

Receptor	Source	Potential Pathway	Consequence of Risk	Probability of Risk	Classification of Risk	Potential Mitigation Measures
Adjacent land-users	Any general soil contamination associated with any remaining made ground	Inhalation of dust/vapours during construction	Minor	Low Likelihood	Very Low Risk	Good site practices such as dust control and good housekeeping will further reduce risk.
		Inhalation of dust/vapours after construction	Minor	Unlikely	Very Low Risk	Any measure required to protect site users will further reduce risk.
	Asbestos contamination of soils, if present	Inhalation of dust/fibres	Medium	Low Likelihood	Moderate/Low Risk	Appropriate asbestos strategy to be developed if asbestos is identified on site. Specialist advice to be sought in accordance with CAR 2012.
Building Materials	Aggressive Ground conditions	Direct contact	Mild	Likely	Moderate/Low Risk	Should investigation identify a potential risk, this could be mitigated through appropriate selection of construction materials.
Water Supply Pipes	General Soil and groundwater contamination associated with any remaining made ground	Corrosion/Permeation	Mild	Likely	Low to Moderate Risk	Should investigation identify a potential risk, this could be mitigated through appropriate selection of construction materials.
Controlled Waters – Secondary Aquifer	General soil and groundwater contamination	Leaching and migration	Mild	Low Likelihood	Low Risk	Removal or treatment of any localised areas of significant contamination encountered will further reduce risk.

6.5 Risk Evaluation

Based on the findings of the desk study, it is considered unlikely that widespread contamination will be present across the site. Localised areas of contamination may, however, be present in areas associated with made ground and specific land uses, such as the car park and electricity substation. Low levels of soil gas could potentially be present associated with any significant thicknesses of made ground.

The risk assessment carried out has indicated the potential risk posed by contamination to construction workers, site end-users, adjacent land users, building materials, water pipes and controlled waters is generally **very low** to **moderate/low**, potentially increasing to a **moderate** risk for construction workers associated in any potential localised areas of asbestos, if present. This assessment assumes that the majority of made ground will be removed as part of the construction of the basement for the development.

The risk posed by ground gas to construction workers and site end-users is deemed to be **Moderate to Low Risk.**

Based on the above it is considered that widespread remedial works are unlikely to be required. Risks can be mitigated as appropriate through the design of buildings and structures, health and safety and environmental controls during construction and the implementation of localised remedial measures if necessary.

It is recommended that he above risk assessment be reviewed in light of an appropriate development specific ground investigation to confirm the levels and distribution of any contamination or ground gas on the site.

7 Engineering Considerations

7.1 Proposed Development

The proposed development will comprise a two storey extension to the existing Kingsgate shopping centre. The extension will connect to the existing building at mall level and upper trading levels with under croft parking. The full area of the development will be hard paved.

7.2 Ground Conditions

Based upon the findings of the desk study, it is anticipated that the site is underlain by made ground overlying glacial deposits and in turn Lower Coal Measures strata.

The made ground is anticipated to be variable in nature and thickness and comprises granular ashy fill and cohesive reworked glacial till containing clinker, slag, brick, coal and sandstone. The glacial deposits are anticipated to comprise predominantly firm to stiff glacial till with the possibility of cobble and boulder beds present above rockhead.

Rockhead has been recorded in the area of the site between approximately 5m to 9m bgl. Sandstone overlying mudstone is indicated to be present at rockhead towards the east of the site, mudstones may be present at rockhead in the far west of the site.

The Soft Bed coal seam is indicated to underlie the site. The seam is typically between 0.3m and 0.6m thick and is anticipated to be present at approximately 20m bgl. The Middle Bed Coal seam is shown by the geological map to subcrop approximately 200m to the east of the site and is indicated to be up to 0.6m thick.

Perched groundwater is anticipated to be present within the made ground and upper drift deposits at approximately 3mbgl.

7.3 Existing Structures

The site has been occupied by a variety of commercial buildings since at least the mid nineteenth century and is currently occupied by a tarmacadam car park, pavement and road with railings and brick walls along the road side.

The former theatre immediately to the north is currently undergoing refurbishment into residential flats. It is also understood that the Oldgate building to the east of the site is scheduled for demolition.

Existing sub ground structures such as foundations and basement associated with former and current buildings on and adjacent to the site will need to be identified, removed or retained during construction.

7.4 Excavations

Excavations and earthworks will be required to create an appropriate development platform on the sloping site and to enable construction of foundations and the proposed basements.

Based on the findings of the desk study, it is considered that conventional plant should be suitable for earthworks and shallow excavations. Breaking out of old foundations and obstructions may be required. Instability in the made ground was noted during ground investigation on the adjacent Kingsgate site. Temporary support of excavations may therefore be required. It is anticipated that some groundwater control may also be required in deeper excavations on the site. It is anticipated that this could be achieved through sump pumping.

7.5 Foundations

The form and nature of the foundations for the scheme will be dependent on the exact nature of the proposed development and ground conditions present.

As the ground conditions beneath the site are anticipated to be variable, it is considered that the foundation solution may also vary across the site as the thickness of made ground, depth to and nature of glacial deposits presence and bedrock vary. Such an approach was adopted for the existing Kingsgate development. This comprised a combination of conventional spread foundations where suitable bearing strata were present at shallow depth and continuous flight auger (CFA) piles, socketed in rock, in area of high load and deep made ground.

7.6 Mining

The findings of the risk assessment carried out indicated the potential risk posed to the proposed development from shallow mine workings to be low.

The shallowest coal seam beneath the site is indicated to be the Soft Band Coal which is anticipated to be present at depths of greater than 20m. No evidence of workings within the seam was encountered in two boreholes sunk as part of the 1998 ground investigation, on the adjacent Kingsgate development.

It is generally accepted that the potential risk posed to surface developments by shallow mine workings is reduced to an acceptable level when the ratio of rock cover to seam thicknesses is 10 or greater, or workings are at a depth greater than 30m.

Based on the currently available information it is considered that if workings are present locally in the Soft Band Coal seam beneath the site, there should be sufficient rock cover to provide a rock cover to seam thickness ratio of greater than 10.

To confirm the above assessment, it is recommended that a number of rotary boreholes are sunk to investigate the depth and thickness of the seam and any evidence of old workings. This should be done as part of a development specific ground investigation.

Monitoring of ground gas should also be carried out as part of the investigation.

7.7 Contamination and Soil Gas

Based on the findings of the desk study, it is considered the potential for widespread contamination to be present across the site is low. Localised areas of contamination may, however, be present in areas associated with made ground and historical industries. Low levels of soil gas could potentially be present associated with any significant thicknesses of made ground.

The risk assessment carried out has indicated the potential risk posed by contamination to construction workers, site end-users, adjacent land users, building materials, water pipes and Controlled Waters is generally **very low** to **moderate/low**, potentially increasing to a **moderate** risk for construction workers associated in any potential localised areas of asbestos, if present. This assessment assumes that the majority of made ground will be removed as part of the construction of the basement for the development.

The risk posed by ground gas to construction workers and site end-users is deemed to be **Moderate to Low Risk.**

Based on the above it is considered that widespread remedial works are unlikely to be required. Risks can be mitigated as appropriate through the design of buildings and structures, health and safety and environmental controls during construction and the implementation of localised remedial measures if necessary.

It is recommended that he above risk assessment be reviewed in light of an appropriate development specific ground investigation to confirm the levels and distribution of any contamination or ground gas on the site.

7.8 Waste

The excavation of basements as part of the proposed development is likely to produce significant quantities of spoil. Consideration should be given to ways in which the amount of excess spoil can be reduced, reused on other site under appropriate licences or exemptions. Excess materials that cannot be reused will need to be classified and disposed of to an appropriately licensed landfill.

Classification of waste materials will be required before offsite disposal. This will require ground investigation and preliminary chemical testing to allow preliminary classification of the materials. Additional testing, to a frequency to satisfy the requirements of the receiving landfill, is also likely to be required prior to disposal. The timing of and costs associated with the additional testing should be considered when developing the contract documents and programme for the proposed development.

8 Recommendations For Future Works

A development specific ground investigation will be required to characterise the ground conditions underlying the site, confirm the absence/presence of any unrecorded mine workings and enable geotechnical and chemical testing, and ground gas and ground water monitoring to be carried out.

The scope of the investigation should be based upon the findings of this desk study and confirmation of the proposed development layout.

The investigation should comprise:

- A series of trial pits to investigate shallow ground conditions at the site, including the presence and nature of any made ground.
- A series of boreholes to investigate the deeper ground conditions beneath the site, including depth to bedrock and coal seams and to investigate the possible presence and extent of any mine workings.
- Installations and subsequent monitoring of gas and groundwater instruments in the boreholes to characterise any ground gas and the groundwater regime beneath the site.
- In-situ and laboratory geotechnical testing to provide parameters for foundation design.
- Chemical testing of soil and groundwater samples to establish the levels of any contamination present.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Batley

Published 1983

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.
They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

VectorMap Local

Published 2015

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Yorkshire

Published 1893

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1974 - 1975

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Ordnance Survey Plan

Published 1991

Source map scale - 1:1,250

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1993

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

Non-Residential Coal Authority Mining Report

KINGSGATE RETAIL, HUDDERSFIELD, WEST YORKSHIRE,

This report is based on and limited to the records held by, the Coal Authority, and the Cheshire Brine Subsidence Compensation Board's records, at the time we answer the search.

Coal mining	See comments below
Brine Compensation District	No

Information from the Coal Authority

Underground coal mining

Past

According to the records in our possession, the property is not within the zone of likely physical influence on the surface from past underground workings.

However the property is in an area where the Coal Authority believe there is coal at or close to the surface. This coal may have been worked at some time in the past. The potential presence of coal workings at or close to the surface should be considered prior to any site works or future development activity. Your attention is drawn to the Comments on Coal Authority Information section of the report.

Present

The property is not in the likely zone of influence of any present underground coal workings.

Future

The property is not in an area for which the Coal Authority is determining whether to grant a licence to remove coal using underground methods.

The property is not in an area for which a licence has been granted to remove or otherwise work coal using underground methods.

All rights reserved. You must not reproduce, store or transmit any part of this document unless you have our written permission. --
© The Coal Authority --

The property is not in an area that is likely to be affected at the surface from any planned future workings.

However, reserves of coal exist in the local area which could be worked at some time in the future.

No notice of the risk of the land being affected by subsidence has been given under section 46 of the Coal Mining Subsidence Act 1991.

Mine entries

There are no known coal mine entries within, or within 20 metres of, the boundary of the property.

Records may be incomplete. Consequently, there may exist in the local area mine entries of which the Coal Authority has no knowledge.

Coal mining geology

The Authority is not aware of any evidence of damage arising due to geological faults or other lines of weakness that have been affected by coal mining.

Opencast coal mining

Past

The property is not within the boundary of an opencast site from which coal has been removed by opencast methods.

Present

The property does not lie within 200 metres of the boundary of an opencast site from which coal is being removed by opencast methods.

Future

The property is not within 800 metres of the boundary of an opencast site for which the Coal Authority is determining whether to grant a licence to remove coal by opencast methods.

The property is not within 800 metres of the boundary of an opencast site for which a licence to remove coal by opencast methods has been granted.

Coal mining subsidence

The Coal Authority has not received a damage notice or claim for the subject property, or any property within 50 metres, since 31st October 1994.

There is no current Stop Notice delaying the start of remedial works or repairs to the property.

The Authority is not aware of any request having been made to carry out preventive works before coal is worked under section 33 of the Coal Mining Subsidence Act 1991.

Mine gas

There is no record of a mine gas emission requiring action by the Coal Authority within the boundary of the property.

Hazards related to coal mining

The property has not been subject to remedial works, by or on behalf of the Authority, under its Emergency Surface Hazard Call Out procedures.

Withdrawal of support

The property is not in an area for which a notice of entitlement to withdraw support has been published.

The property is not in an area for which a notice has been given under section 41 of the Coal Industry Act 1994, revoking the entitlement to withdraw support.

Working facilities orders

The property is not in an area for which an Order has been made under the provisions of the Mines (Working Facilities and Support) Acts 1923 and 1966 or any statutory modification or amendment thereof.

Payments to owners of former copyhold land

The property is not in an area for which a relevant notice has been published under the Coal Industry Act 1975/Coal Industry Act 1994.

Comments on Coal Authority information

In view of the mining circumstances a prudent developer would seek appropriate technical advice before any works are undertaken.

Therefore if development proposals are being considered, technical advice relating to both the investigation of coal and former coal mines and their treatment should be obtained before beginning work on site. All proposals should apply good engineering practice developed for mining areas. No development should be undertaken that intersects, disturbs or interferes with any coal or mines of coal without the permission of the Coal Authority. Developers should be aware that the investigation of coal seams/former mines of coal may have the potential to generate and/or displace underground gases and these risks both under and adjacent to the development should be fully considered in developing any proposals. The need for effective measures to prevent gases entering into public properties either during investigation or after development also needs to be assessed and properly addressed. This is necessary due to the public safety implications of any development in these circumstances.

Information from the Cheshire Brine Subsidence Compensation Board

The property lies outside the Cheshire Brine Compensation District.

Additional Remarks

Information provided by the Coal Authority in this report is compiled in response to the Law Society's Con29M Coal Mining and Brine Subsidence Claim enquiries. The said enquiries are protected by copyright owned by the Law Society of 113 Chancery Lane, London WC2A 1PL. Please note that Brine Subsidence Claim enquiries are only relevant for England and Wales. This report is prepared in accordance with the Law Society's Guidance Notes 2006, the User Guide 2006 and the Coal Authority and Cheshire Brine Board's Terms and Conditions applicable at the time the report was produced.

The Coal Authority owns the copyright in this report. The information we have used to write this report is protected by our database right. All rights are reserved and unauthorised use is prohibited. If we provide a report for you, this does not mean that copyright and any other rights will pass to you. However, you can use the report for your own purposes.
