Executive Summary

Appointment	In March 2020, Curtins were instructed by Pegasus Planning on behalf of Kirklees Council to undertake a Preliminary Site Assessment (PSA) or 'Desk Study' for a site located at Lockwood Road, Lockwood, Huddersfield. The proposed site developemtn is for a new road junction.
Current Site Status	The site comprises a parcel of land, located on Lockwood Road, Kirkleees, Huddersfield, at approximate National Grid Reference SE 13757 15306. The site is currently occupied by a hand car wash (on the site of a former petrol station) and a car tyre garage. The site is split in two levels with the tyre garge to the south being approximately 1m lower than the car wash.
Site History	From the earliest available mapping in the 1850s until the 2000s, the site has had various commercial and industrial uses, including Works and a garage (fuel station) and more recently, a car wash and tyre shop.
Geology	The site is underlain by sandstone of Rough Rock. Geological records indicate that alluvial superficial deposits may be present comprising heterogeneous sands, gravels and clays.
Hydrogeology	The bedrock and superficials are classified as a Secondary A Aquifer. The site is not situated within a Source Protection Zone and there are no active groundwater abstractions within 500 m of the subject site.
Hydrology	The nearest surface water feature to the site is the River Holme located approcimately 60m to the north of the site.
Initial Ground Contamination Assessment	With reference to the history of the site and immediate surrounding area, the qualitative risk assessment (QRA) determined an overall high level of risk associated with the proposed development. The risk presented to the development from ground gases is assessed as low to moderate at this stage with potential sources identified as shallow made ground deposits and the underlying fuel tanks.
Recommendations	The following recommendations are made: • Undertake an intrusive ground investigation to support civil and structural design. • Undertake screening of site soils (visual, olfactory) with basic contamination screening (lab testing) to inform CDM and preliminary waste classification. Additional testing should be undertaken if and where any markers of contamination are revealed. • Undertake GQRA to further assess the risk presented by ground gases on-site, consideration could be given to the adoption of the no-monitoring approach to ground gas risk assessment as detailed within CL:AIRE Research Bulletin 17 (RB17). The requirement for additional surveys, e.g. archaeological or ecological, should be confirmed through advice from a suitably qualified and experienced professional.

1.0 Introduction

1.1 Brief

In March 2020, Curtins was instructed by Pegasus Planning on behalf of Kirklees Council to undertake a Preliminary Site Assessment (PSA) or 'Desk Study' for a site located at Lockwood Road, Lockwood, Huddersfield.

The PSA report has been undertaken in support of the proposed re-development of the Lockwood Road and Crowther Street jucnction to form a new wider junction referred to as the Lockwood Bar Junction. The proposed works comprise alterations to the existing junction, with improved pedestrian crossing facilities, public realm enhancements, a new bus gate and relocated / enhanced bus stop facilities.

1.2 Scope

The Preliminary Site Assessment (PSA) is intended to provide an overview of the geo-environmental setting of the site, develop both a working conceptual and ground model for the site as well as present an initial assessment of geo-environmental risks that could be presented to the development including its intended site users and the wider environment.

Specifically, the PSA provides an initial assessment of the site with regard to:

a) Potential contamination of the site strata by historical and or current use.
b) The potential impact on the wider environment by historical and or current use of the site of interest.
c) The potential impact from surrounding land uses and other environmental factors.
d) Potential problems associated with geological features such as faulting, mineral extraction, mining and land instability.
e) The location of apparent sub-surface structures that may affect the proposed redevelopment.
f) The location of above-surface features that may affect the proposed redevelopment.

The PSA is desk-based exercise with no ground investigations or intrusive works undertaken in support of its findings. In addition, the aim of the report is to establish the requirement for/extent of any further investigations.

2.0 Desk Study

The following sources of information have been consulted for the proposed scope of the works, highlighted in Section 1.1. These sources do not include on-site intrusive investigations or testing.

- Envirocheck Report
- Coal Authority Mining Records
- British Geological Society records
- UK Radon website

2.1 Current Setting

A site walkover has been completed on 22nd May 2020 by Curtins. The site comprises a parcel of land, as shown on Figure 2.1, located on Lockwood Road, Kirklees, Huddersfield, at approximate National Grid Reference SE 13757 15306. The site is currently occupied a number of brick structures (car wash offices and a tyre shop), metal storage units, storage tanks, a car wash canopy with the majority of the site covered by hardstanding The hardstanding is predominantly in good conditions. It is anticipated that the underlying tanks relevant to the historic fuel station (garage) on site are remaining in-situ, as no signs indicating removal (e.g. scaring of tarmac) were observed. The site is split across two levels with the southern part of the site (occupied by the tyre garage) approximately 1m lower than the car wash with an approximate elevation of 70m aOD. The boundary between the two site uses is by retaining wall and aramped access.

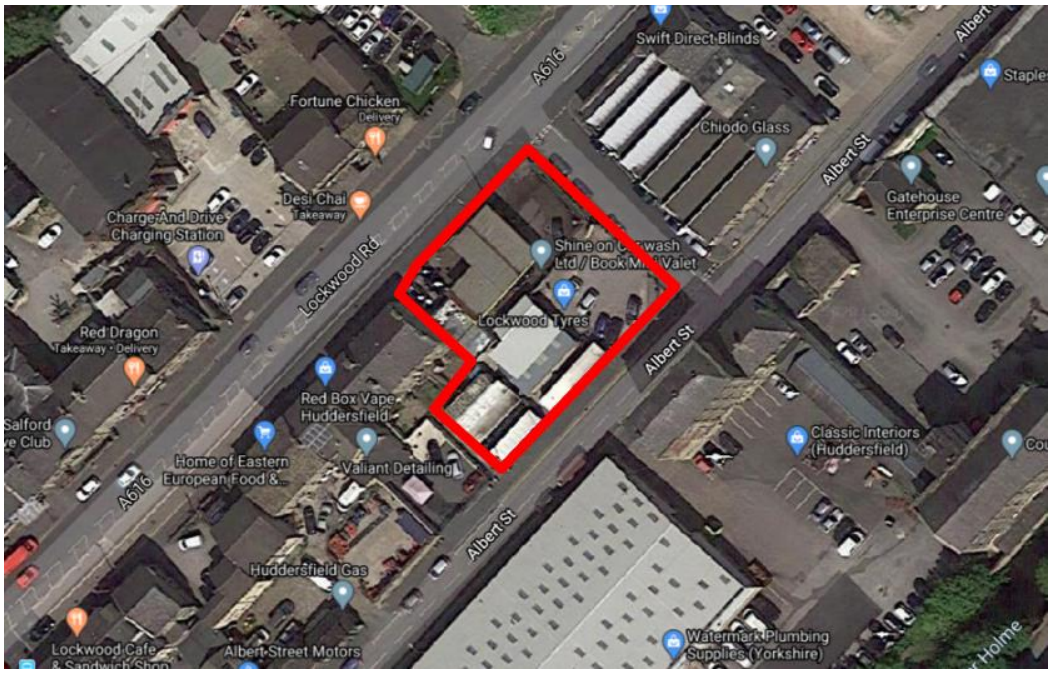

Figure 2.1 *Site Location Plan*

(Approximate development sites outlined in red.)

2.2 Surrounding Land Use

The following information was also established during the site visit and through undertaking an environmental database search (Envirocheck report (1), Appendix C)

Table 2.2 *Surrounding Area*

Surrounding Area	N	Crowther Street with commercial/ industrial buildings beyond (Direct Blinds)
	E	Albert Street with commercial industrial buildings beyond (furniture store and plumbing and heating supplies)
	S	Two-storey Residential Buildings
	W	Lockwood Road (A616)

3.0 Site History

The available historical maps and other sources information for the site have been reviewed. The findings are summarised in Table 3.0a and Table 3.0b.

Table 3.0a *Previous Site Uses and Potential Sources of Contamination*

Date	Description	Potential Sources of Contamination
1850s – 1920s	The site comprises a number of small building, likely to be residential properties.	Potential for deep made ground deposits due to the several phases of development undertaken on site. Localised spillages and leakages associated with onsite works operations. Potential for contamination from leakage and spillage from underground fuel storage tanks containing hydrocarbons.
1920s – 1960s	The site is occupied by a number of buildings. A building to south of the site is now marked as “Works”.	
1960s – 1975s	The smaller buildings have been demolished and are now replaced with a large unmarked structure.	
1975s – 2000s	The building is no longer apparent and a “garage” likely to be a fuel station is present on site. A new brick building has been developed to southeast of the site in 2012.	
Present	Currently the site is occupied by a car wash with associated water tanks, a number of brick structures and the car wash canopy. The site is predominantly covered by hardstanding. A Tyres shop is present to southeast of the site.	

Table 3.0b *Surrounding Land Uses and Potential Sources of Contamination*

Date	Description	Potential Sources of Contamination
1850s – 1920s	School with associated green spaces present to west and northwest of the site. A chapel is present to northwest of the site. Buildings are present to south and north of the site. A warehouse is present to east of the site.	Similarly, to the on-site sources, the made ground in the vicinity of the area is considered the primary source of contamination in addition to the potential for mobile phase contmiantion to have migrated to site from adjacent industrial former land uses..
1960s – 1980s	Works are present to north and northwest of the site. Mill is present to west, northwest and southeast of the site. Building Yard is present to northeast and southwest of the site. Sheet Metal works is present to west of the site.	
1980s – 1990s	The mill to northeast is now marked as a “Industrial state”. The works to northwest has been replaced with open space, associated with the school. The Gatehouse Enterprise centre is present to northeast of the site	
Present	To north of the site, industrial structures are present. To northeast and east an industrial estate is present. To south a number of industrial structures are present. To northwest the school with associated landscaping is present.	

Limited information is available relating to the site history before the 1850s when the first ordnance survey maps were produced.

3.1 Unexploded Ordnance

The Hazard Screen ask two key questions:

Are there any indicators of former military use on the Sites? No (no evidence on historical mapping and internet searches).

Are there indicators of historical bombing on the Sites? No. there is no evidence of the site having received direct strikes from ordnance (no change in footprint on historical mapping and internet searches).

In addition, it is indicated that superficial deposits are not present on site, therefore, if present, they maybe of insignificant thickness. It is further noted that the site has undergone multiple stages of redevelopment since world war two, which increases the likelihood of encountering UXO already and therefore, further reducing the likelihood of UXO being present on site.

Conclusion: No indicators of military land use or historical bombing are noted on site and therefore, no further risk assessment is recommended.

Recommendation: It is recommended that a generic emergency response plan is put in place, for all planned activities, to deal with any unforeseen UXO encounters.

4.0 Geology, Hydrogeology and Hydrology

4.1 Geology and Hydrogeology

A study of the Envirocheck records (2) and British Geological Survey (BGS) 1:50,000 map (Sheet 77, Huddersfield, Solid and Drift, 2003) indicates the following geological sequence underlying the site:

Table 4.1 *Geological/Hydrogeological Succession*

Geology	Associated Hydrogeological Classification
Superficial deposits are not indicated to be present on site, however due to proximity of the site to where alluvium is recorded, limited amounts of alluvium deposits are anticipated likely. The alluvium is indicated to comprise clay, silt, sand and gravel.	The Superficial deposits and the bedrock are both listed as Secondary A Aquifer. The site is within a High Vulnerability, Secondary Aquifer zone. The site is not within a Source Protection Zone (SPZ). There are no active groundwater abstractions within 500 m of the subject site.
Solid deposits are recorded as the Rough Rock. The Rough Rock is from Yeadonian Substage and it is recorded to comprise sandstone.	

Notes:

1. This has been assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.
2. These are permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers.

4.1.1 Existing Ground Investigation/BGS Data

No existing ground investigation data has been made available for the site.

No historic British Geological Survey (BGS) exploratory holes are present within the site boundaries.

A number of BGS exploratory holes are present within a 200m radius of the site. The exploratory holes, located to north of the site indicate made ground overlaying typically firm clayey deposits, which in turn overlay the weathered sandstone. The weathered rockhead within this area is recorded at between 2.8m bgl to 4.8m bgl. The bedrock within the boreholes to south of the site, is recorded to comprise

significant thickness of predominantly granular made ground over laying weathered bedrock at depths between 2.0m bgl and 3.5m bgl.

4.1.2 Mining & Mineral Extraction

The site does not lie within a coal mining development high risk area. A development high risk area is designated approximately 1km east of the site.

Five recorded mineral sites are present within 500m of the site (>200m away). The activities at these sites have now ceased. These sites comprised four opencast sandstone sites (226m, 226m and 335m and 424m outside site boundary) and a Deep Coal Mine (237m outside site boundary).

4.1.3 Ground Stability Issues

The Envirocheck report (2) confirms that there is a low to no hazard from the following ground stability hazards on the site; collapsible, compressible, dissolution, running sand and shrinking or swelling clay. The Envirocheck report indicates moderate risk of landslide for the site.

4.1.4 Land Gas

There are no historical or currently operational landfill sites within 250 m of the site.

The UK Radon Mapping (3) and the Envirocheck report (2) confirms that the property is in an lower probability radon area, where less than 1% of properties are estimated to be above the radon action level.

On this basis, basic radon protection measures are not considered necessary within the construction of new dwellings or extensions.

4.2 Hydrology

The nearest surface water feature to the site is the River Holme, approximately 65m to the south of the site.

No discharge consents or control permits are recorded on the site.

The site is within an area with potential for groundwater flooding from rivers and the sea.

There are no active groundwater abstractions within 500 m of the subject site. The permission for the three water abstraction sites (within 500m radius) has been revoked.

5.0 Conceptual Site Model & Qualitative Risk Assessment

The Conceptual Site Model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table within this section.

The CSM details the source-pathway-receptor linkages or potential contaminant linkages (PCLs) that have been identified for the site. The QRA details the associated level of risk relating to these PCLs.

The CSM and QRA concern the major risks to human health and controlled waters with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in Section 5.1 below.

The QRA follows the framework outlined within CIRIA C552 which is summarised within Appendix D.

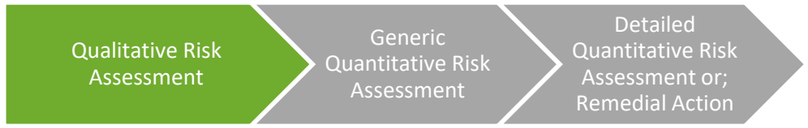

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PCL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

5.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but none-the-less can be of critical importance to the onward development of the site.

- The risk presented by **Mining and Mineral Extraction** is discussed and assessed in Section 4.1.2.
- The risk presented by **Radon** is discussed and assessed in Section 4.1.4.
- The risk presented by **Unexploded Ordnance** is discussed in Section 3.2 and assessed in Appendix A4.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations, 2015 which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements and therefore construction workers involved in the building works at the site have been discounted as a human receptor in the conceptual site model.

- The table below represents the first stage in the land quality risk assessment process; **the Qualitative Risk Assessment**.
- In order for a development site to be deemed 'suitable for use' the level of risk needs to be brought down to acceptable levels, i.e. low to negligible risk. The purpose of each stage of risk assessment is ultimately to establish if there is a requirement for additional levels of assessment to be made in order to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.

Conceptual Site Model			Qualitative Risk Assessment			Action
Source	**Pathway(s)**	**Receptor(s)**	**Consequence (Potential Severity)**	**Likelihood of Occurrence**	**Risk Rating**	
On-site sources of potential contamination: Made ground is the primary source of contamination on site. Due to the phases of development and the industrial and commercial history of the site there is apotential for the Made Ground to be contmianted with a range of organic and inorganic contaminants including asbestos, hydrocarbons and heavy metals.	**Direct contact and ingestion and inhalation of soils and soild derived dust**	**End users of site** Members of the public	**Medium** Chronic health risk	**Unlikely** The proposed end use of the site is as a road junction with small amounts of open space. It is considered unlikely that pedestrians will spend long periods of time on site with the open space not designed to or likely to be conducive to high quality ammentity space. The potential for exposure to contamination is therefore considered unlikely. There are currently no soft landscaping areas on site and as such any new areas of soft landscaping will be imported.	**Low**	Confirm no free product or gross contamination is present within the shallow site soils. Basic contaminative screening of soils for CDM & preliminary waste classification. Confirm the quality of imported soils used for soft landscaping.
		Adjacent Site Users/ residents	**Medium** Chronic health risk		**Low**	
	Vertical migration through the Made Ground and residual soils) May occur due to processes including; capillary action, burrowing animals inducing soil mixing and downwards into the natural deposits through infiltration.	**Controlled waters (Groundwater)** Superficial and Bedrock – Secondary A No abstractions within 500m of the site.	**Medium** Pollution of sensitive water resources	**Low Likelihood** Despite the high likelihood of contamination being present within the ground, the majority of the poroposed development will be hardstanding, likely with managed drainage and as such immobilisation of underlying contmiantion is considered a low likelihood. However dome areas of soft landscaping are planned and as such an overall increase in infiltration at the site is anticipated.	**Moderate / Low**	***Generic Quantitative Risk Assessment*** *Recommended as part of the ground investigation.*
		Controlled waters (Surface water) River Holme (c. 65 m) from site.	**Medium** Pollution of sensitive water resources			
On-site sources of potential contamination: On-site filling station and underground storage tank with potential historical spillages and leakages of fuel. *Potential contaminants of concern associated with the above source include petrol and diesel rangehydrocarbons*	**Inhalation of vapours (filling station and underground fuel tanks)**	**End users of site** Members of the public	**Medium** Chronic health risk	**Unlikely** No permanent structures or enclosed spaces are proposed and as such the potential for build up of vapours hazardous to health is considered unlikely.	**Low**	No further action

Conceptual Site Model			Qualitative Risk Assessment			Action
Source	**Pathway(s)**	**Receptor(s)**	**Consequence (Potential Severity)**	**Likelihood of Occurrence**	**Risk Rating**	
		Adjacent Site Users/ residents	**Medium** Chronic health risk	**Likely** Based on the historical mapping, the subject site has predominately been within its current configuration since 1980s. It is not known when the Fuel Station was exactly built, however adopting a worst-case scenario the tank could have been present since 1980s, as such there is potential for the integrity of the tank to have been compromised over that timeframe to present day therefore a potential release of fuel into the subsurface. Residential properties are present adjacent to the site boundary.	**Moderate**	***Generic Quantitative Risk Assessment*** *Recommended as part of the ground investigation.* *Decommissioning and sae removal of USTs*
	Vertical migration through the superficial deposits (soils) May occur due to processes including; capillary action, burrowing animals inducing soil mixing and downwards into the natural deposits through infiltration.	**Controlled waters (Groundwater)** Superficial and Bedrock – Secondary A No abstractions within 500m of the site.	**Medium** Pollution of sensitive water resources	**Likely** Based on the historical mapping, the subject site has predominately been within its current configuration since 1980s. It is not known when the Fuel Station was exactly built, however adopting a worst-case scenario the tank could have been present since 1980s, as such there is potential for the integrity of the tank to have been compromised over that timeframe to present day therefore a potential release of fuel into the subsurface. As such there is a likely risk to controlled waters.	**Moderate**	
Off-site sources of potential contamination: Made ground is the primary source of contamination in the vicinity of the site. Due to the industrial and commercial history of the surrounding area, the probability of this made ground containing significant contaminants is high. These include: Asbestos, hydrocarbons, solvents and heavy metals.	**Horizontal migration through the shallow soils and air (dust/particulates)** Followed by… Direct contact, ingestion, inhalation (dust)	**End users of site** Members of the public	**Medium** Chronic health risk	**Unlikely** The proposed end use of the site is as a road junction with small amounts of open space. It is considered unlikely that pedestrians will spend long periods of time on site with the open space not designed to or likely to be conducive to high quality ammentity space. The potential for exposure to contamination is therefore considered unlikely.	**Low**	Confirm no free product or gross contamination is present within the shallow site soils
On and off-site soils with the potential to generate ground gases Potential for deep made ground deposits.	**Vertical and horizontal migration through the residual (incl. Made Ground) and bedrock deposits**	**End users of site** Members of the public	**Severe** Acute health risk, e.g. asphyxiation or risk from explosion.	**Unlikely** No permanent structures or enclosed spaces are proposed and as such the potential for build up of vapours hazardous to health is considered unlikely.	**Low**	No further action

6.0 Preliminary Engineering Assessment

The ground conditions on site are anticipated to comprise a significant thickness of made ground, overlaying limited thickness of alluvium, which in turn overlays the weathered bedrock of sandstone.

Made ground is anticipated to be of variable nature and as such, it is not likely to provide a suitable sub-formation for the proposed works. Suitability of the made ground for re-use across the site can be confirmed, following further intrusive ground investigations along with in-situ and laboratory testing.

Where made ground is proven to be unsuitable, it must be removed and replaced with suitably compacted granular material to reach the required sub-formation levels.

Suitability of the underlying superficial deposits, where present, to form the sub-formation cannot be confirmed at this stage. Due to presence of alluvium deposits, the presence of soft/loose deposits are considered likely. Where present, these deposits shall be improved or removed and replaced with suitably compacted granular material.

It is noted, however that the existing hardstanding and road way appear in good conditional and do not show signs of instability. Crowther Street has been subject to relatively recent repair however a review of the historical street view mapping shows that this may be due disbanding of the tarmac surfacing forom the underlying cobble sets. Until further intrusive investigation it cannot be confirmed if any ground improvement (e.g. significant thicknesses of subbase or geogrid) have been used in the existing pavement design.

Owing to the potential for conamtination within shallow soils it is considered u likely that soakaways would be considered viable as part of the scheme.

7.0 Conclusions & Recommendations

The qualitative risk assessment (QRA) determined an overall low/moderate level of level of risk to future site users associated with the proposed development.

The QRA concluded by recommending that a generic quantitative risk assessment (GQRA) was conducted in order to confirm the risks to human health (offsite residents) and controlled waters relating predominantly to the history of bulk fuel storage at the site.

It is recommended that the GQRAs are conducted as part of a ground investigation in support of the engineering design of the proposed development, an outline scope for which is detailed in the section hereafter.

In summary, the following recommendations are made:

- Undertake an intrusive ground investigation to support civil and structural design.
- Undertake screening of site soils (visual, olfactory) with basic contamination screening (lab testing) to inform CDM and preliminary waste classification. Additional testing should be undertaken if and where any markers of contamination are revealed.
- Undertake GQRA to further assess the risk presented by hydrocarbons (vapours And mobile phase contamination) to off-site residents and controlled waters (River Holme).

It is recommended that this work is completed in advance of any development works taking place.

6.1 Outline Scope of Works for Ground Investigation

Site-wide made ground and the likely underlying fuel tank, containing hydrocarbons, have been identified as the primary potential sources of contamination on site as part of the Phase 1 Preliminary Site Assessment owing to the industrial and commercial site history. On this basis a semi targeted sampling strategy is recommended in order to obtain representative coverage of the site and target the former tank area and associated risk to adjacent residents.

It is envisaged that the ground investigation will comprise the following, all undertaken under the supervision of a suitably qualified engineer:

- Underground utilies surveuy (e.g GPR survey) to identify tank beds and associated infrastructure.
- A series of shallow boreholes to obtain representative coverage of the site shallow geology:
    - Provide reliable geotechnical information,
    - Enable recovery of geotechnical and environmental samples;
    - Enable in-situ testing of underlying strata (pavement design);

- Associated geotechnical and environmental laboratory testing - to develop a working ground model, classify excavated material for re-use on site or off-site disposal and assess the potential risk to construction workers site.
- Visual inspection of materials present on site for signs of gross contamination with consideration for groundwater and potentially vapoutr sampling.

Subject to the findings of the outline ground investigation detailed above, there may be the requirement for additional investigations.

6.2 Other Considerations

It is recommended that a specification for safe removal of Underground Storage Tanks is prepared to ensure appropriate decommissioning and validation of removal is undertaken to minimise the risk to ground waorkers and the environement during site clearance and construction.

The requirement for additional surveys, e.g. archaeological or ecological, should be confirmed through advice from a suitably qualified and experienced professional.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Agency & Hydrological					
BGS Groundwater Flooding Susceptibility	pg 1	Yes	Yes	Yes	n/a
Contaminated Land Register Entries and Notices					
Discharge Consents	pg 3		10	6	56
Prosecutions Relating to Controlled Waters			n/a	n/a	n/a
Enforcement and Prohibition Notices	pg 20				1
Integrated Pollution Controls					
Integrated Pollution Prevention And Control					
Local Authority Integrated Pollution Prevention And Control					
Local Authority Pollution Prevention and Controls	pg 21		2	3	14
Local Authority Pollution Prevention and Control Enforcements					
Nearest Surface Water Feature	pg 23		Yes		
Pollution Incidents to Controlled Waters	pg 23		6	2	35
Prosecutions Relating to Authorised Processes	pg 31				1
Registered Radioactive Substances					
River Quality	pg 31		1		4
River Quality Biology Sampling Points					
River Quality Chemistry Sampling Points	pg 32				1
Substantiated Pollution Incident Register	pg 32			1	5
Water Abstractions	pg 33		2	1	20 (*46)
Water Industry Act Referrals	pg 50				1
Groundwater Vulnerability Map	pg 50	Yes	n/a	n/a	n/a
Groundwater Vulnerability - Soluble Rock Risk			n/a	n/a	n/a
Groundwater Vulnerability - Local Information			n/a	n/a	n/a
Bedrock Aquifer Designations	pg 51	Yes	n/a	n/a	n/a
Superficial Aquifer Designations	pg 51	Yes	n/a	n/a	n/a
Source Protection Zones					
Extreme Flooding from Rivers or Sea without Defences	pg 51	Yes		n/a	n/a
Flooding from Rivers or Sea without Defences	pg 51	Yes	Yes	n/a	n/a
Areas Benefiting from Flood Defences				n/a	n/a
Flood Water Storage Areas				n/a	n/a
Flood Defences				n/a	n/a
OS Water Network Lines	pg 51		3	6	21

Geological					
BGS 1:625,000 Solid Geology	pg 59	Yes	n/a	n/a	n/a
BGS Estimated Soil Chemistry	pg 59	Yes	Yes	Yes	Yes
BGS Recorded Mineral Sites	pg 65		3	2	2
BGS Urban Soil Chemistry					
BGS Urban Soil Chemistry Averages					
CBSCB Compensation District			n/a	n/a	n/a
Coal Mining Affected Areas	pg 66	Yes	n/a	n/a	n/a
Mining Instability	pg 66	Yes	n/a	n/a	n/a
Man-Made Mining Cavities					
Natural Cavities	pg 66		1		
Non Coal Mining Areas of Great Britain	pg 67	Yes		n/a	n/a
Potential for Collapsible Ground Stability Hazards	pg 67	Yes	Yes	n/a	n/a
Potential for Compressible Ground Stability Hazards	pg 67	Yes		n/a	n/a
Potential for Ground Dissolution Stability Hazards				n/a	n/a
Potential for Landslide Ground Stability Hazards	pg 67	Yes	Yes	n/a	n/a
Potential for Running Sand Ground Stability Hazards	pg 67	Yes		n/a	n/a
Potential for Shrinking or Swelling Clay Ground Stability Hazards	pg 67	Yes		n/a	n/a
Radon Potential - Radon Affected Areas			n/a	n/a	n/a
Radon Potential - Radon Protection Measures			n/a	n/a	n/a
Industrial Land Use					
Contemporary Trade Directory Entries	pg 69	2	81	54	166
Fuel Station Entries	pg 95		2	1	3
Points of Interest - Commercial Services	pg 96	2	15	19	63
Points of Interest - Education and Health					
Points of Interest - Manufacturing and Production	pg 104		13	6	83
Points of Interest - Public Infrastructure	pg 113		7	12	22
Points of Interest - Recreational and Environmental	pg 116		3	6	6
Gas Pipelines					
Underground Electrical Cables

Please note that the Environment Agency / Natural Resources Wales / SEPA have a charging policy in place for enquiries.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

Yorkshire

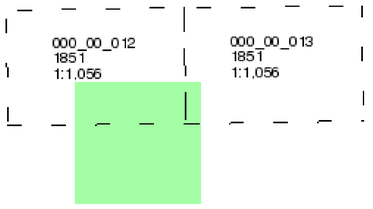

Published 1851

Source map scale - 1:1,056

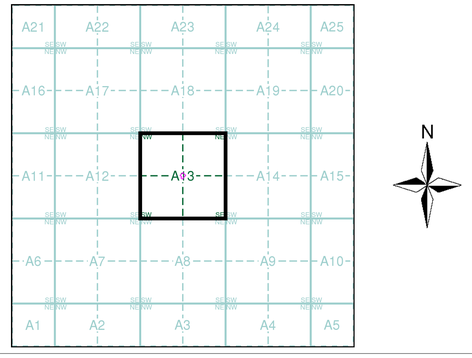

The 1:1056 scale of Ordnance Survey mapping was adopted from Ireland in 1848 and was used to survey towns with a population of over 4000, plus county towns of lesser population, in those counties mapped at the six-inch scale in 1841-55. The scale was the largest scale at which London was mapped by the Ordnance Survey and a 'skeleton' survey of the capital, showing little more than streets, street names, frontages and altitudes, was undertaken between 1848 and 1850. The majority of the 1:1056 surveys were later replaced by 1:500 surveys; although almost all the remainder were revised at this scale, sometimes more than once before 1895. The type of detail shown on the 1:1056 scale is broadly similar to that on 1:500; the apparent omission of minor details such as sewer access points and street lights may be as much a reflection of the generally earlier date of these plans, as of the specification of the map.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Yorkshire

Published 1890

Source map scale - 1:500

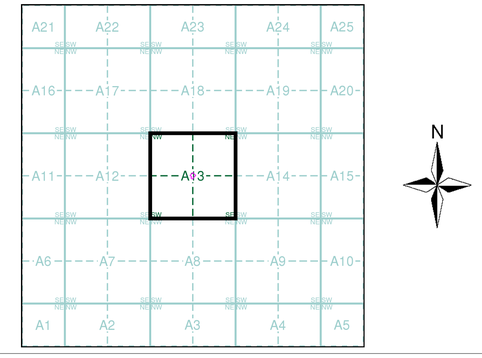

The 1:500 scale Ordnance Survey mapping was introduced in 1855 as a replacement for the 1:528 scale and to compliment the 1:2500 scale that had been implemented in 1853. By 1895, the 1:500 scale covered most towns over a population of about 4000 at the time of survey, although very few towns were mapped more than once at this scale, and none have been since 1910. The 1:500 scale gives particular emphasis to such features as lamp posts, man holes, arched passages and minor building projections. Also often featured are divisions between tenements, interior ground floor layouts of public buildings, and on earlier plans, the functions of the various parts of larger industrial premises are also indicated. Content of the plans does vary however, from one town to the next in terms of, for example, the completeness of railway tracks and the coverage of public buildings.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Published 1893

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1975

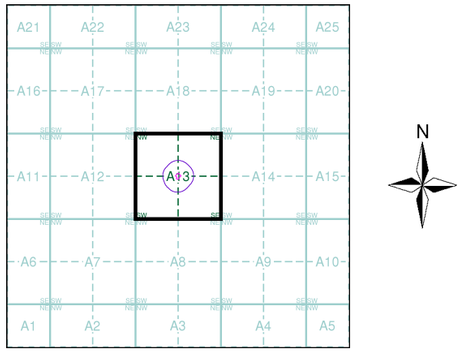

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs

Published 1984 - 1992

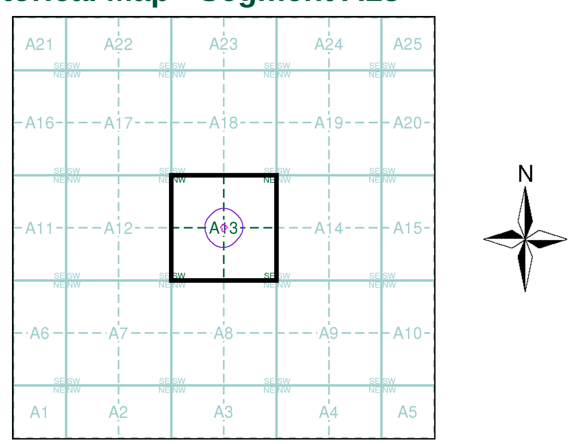

Source map scale - 1:1,250

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993

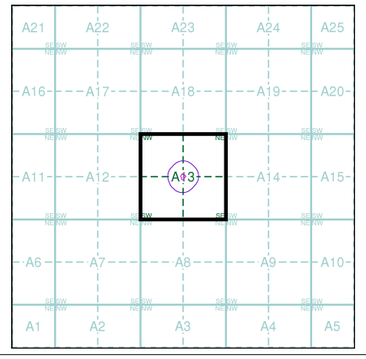

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Published 1854

Source map scale - 1:10,560

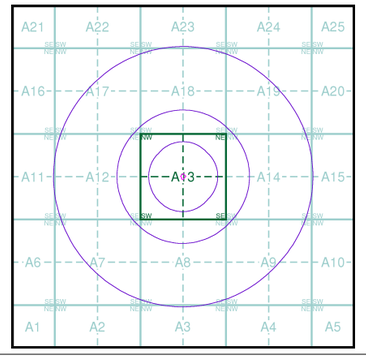

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Yorkshire

Published 1938

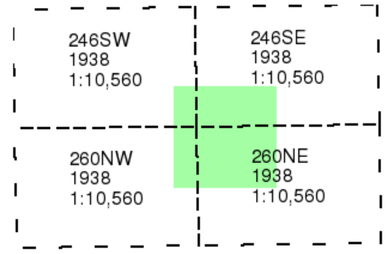

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Batley

Published 1983

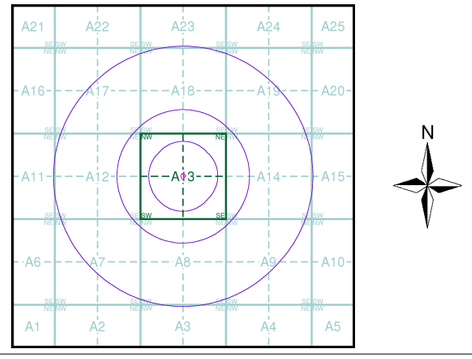

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.
They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 2000

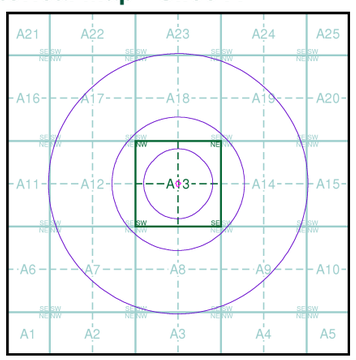

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2020

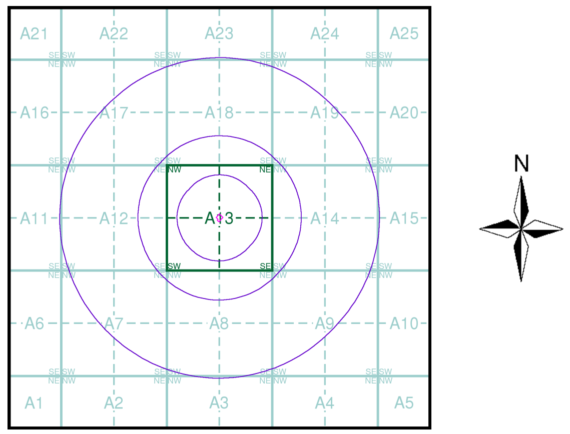

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Appendix C – Qualitative Risk Assessment Rationale

The site-specific qualitative risk assessment of environmental harm, is summarised in the table presented in Section 3.0 of this reporting; the principle being to establish connecting links between a hazardous source to a potential receptor via an exposure pathway.

The qualitative risk assessment corresponds with the total site area.

Risk assessment is the process of collating known information on a hazard or set of hazards in order to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the hazardous source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore the presence of hazard on a site does not necessarily mean there is a risk.

By considering where a viable pathway exists which connects a source with a receptor the risk assessment in Section 3.0 and the table presented therein identifies where pollutant linkage exists. If there is no pollutant linkage there is no risk and only where a pollutant linkage is established does the risk assessment consider the level of risk.

The risk assessment considers the likelihood of a particular event taking place (accounting for the presence of the hazard and receptor and the integrity of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances actually occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	**Medium**	**Mild**	**Minor**
Probability (Likelihood)	**High Likelihood**	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to a particular ecosystem or organisation forming part of such ecosystem.	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in a particular ecosystem or organism forming part of such ecosystem.	Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria. Leaching of contaminants from a site to a Principal or Secondary A aquifer. Death of a species within a designated nature reserve. Lesser toxic and asphyxiate effects
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater (Inc. Secondary B aquifers). Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discoloration of concrete.

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place, and is less likely in the shorter term.
Unlikely	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a *high probability* that *severe harm* could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	*Harm* is *likely to arise* to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	*It is possible* that without appropriate further action *harm could arise* to a designated receptor. It is relatively *unlikely* that any such harm would be *severe*, and if any harm were to occur it is *more likely* that such harm would be *relatively mild.*
Low Risk	*It is possible* that *harm could arise* to a designated receptor from an identified hazard. It is *likely* that, at worst, if any harm was realised any effects would be *mild.*
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term ‘risk’ in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.

Our Locations

Birmingham
2 The Wharf
Bridge Street
Birmingham
B1 2JS
T. 0121 643 4694
birmingham@curtins.com

Bristol
