

Please take this as a strong objection.

I am shocked and saddened to think that a monstrous project like this could even be up for consideration in a green belt area. Haven't we got enough brown belt sites already sat waiting to do something?

Also, very concerning, is the fact that this proposal seems to exceed the 50 Mega Watt rule. Are the project managers and leaders of this already trying to pull the wool over our eyes, or are they unaware of the correct regulations? This is worrying, it begs the question: what else are they trying to do against regulations?

This area has a dense bat and owl population and is a route through for deer. A project like this could have a major impact on the local protected and unprotected wild life habitat.

This project also offers nothing for the local community: No jobs, no outside spending from visitors to name but two and I could go on.

Surely, we should be preserving this land as farm land and treasuring it as a valuable place to grow our food, especially now we've left the European Union and have an ever growing population. Farming also provide local jobs.

What about the flood plain which will be heavily impacted? The river, being fed from the surrounding streams and becks, bursts its banks once a year already, on many occasions causing severe damage to property.

This is a special green space, enjoyed by so many - why on Earth would anyone think it appropriate to replace it with a solar farm? Of course, global warming and CO2 emissions have got to be addressed, but let's carefully weigh up what is going to be lost for ever in this case.

The unspoiled countryside is what brought me to live in this area in the first place and it should remain that way for generations to come, for everyone to enjoy!

I object to this project.
