Introduction

Waterco has been commissioned to undertake a Drainage Strategy in relation to a proposed clay quarry extension at Peace Wood Quarry, Huddersfield, HD8 8LH.

The aim of this Drainage Strategy is to identify water management measures to ensure the quarry void remains operational (flood free) during the 1 in 30 year plus 25% Climate Change storm event whilst ensuring flood risk elsewhere is not increased.

Existing Conditions

The site covers an area of approximately 2.31 hectares (ha) and is located at National Grid Reference (NGR): 421674, 411233. A location plan and an aerial image are included in Appendix A.

Online mapping (including Google Maps / Google Streetview imagery, accessed December 2022) shows that the site comprises agricultural land intersected by an existing access road to Peace Wood Quarry. The site is bordered by Peace Wood Quarry to the north, agricultural land and residential properties to the east, Huddersfield Road to the south and agricultural land to the west. Access to the site is provided from Huddersfield Road (B6116) to the south.

Local Topography

Topographic levels to metres Above Ordnance Datum (m AOD) have been derived from a 1m resolution Environment Agency (EA) composite 'Light Detecting and Ranging' (LiDAR) Digital Terrain Model (DTM). A review of LiDAR data shows that the site slopes from approximately 202m AOD in the north-west to approximately 191m AOD in the east. A LiDAR extract is included in Appendix B.

Ground Conditions

Published Geology

The British Geological Survey (BGS) online mapping (1:50,000 scale) indicates that the site is underlain by the Penistone Flags geological unit which forms part of the Pennine Lower Coal Measures Formation consisting of mudstone, siltstone and sandstone.

The geological mapping is available at a scale of 1:50,000 and as such may not be accurate on a site-specific basis.

Hydrogeology

According to the EA's Aquifer Designation data, obtained from MAGIC's online mapping [accessed December 2022], the Pennine Lower Coal Measures Formation is classified as a Secondary A Aquifer.

Secondary A Aquifers are 'permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers'.

The EA's 'Source Protection Zones' data, obtained from MAGIC's online mapping [accessed December 2022], indicates that the site is not located within a Groundwater Source Protection Zone.

The Cranfield University 'Soilscapes' map [accessed December 2022] indicates that the site is underlain by '*Freely draining slightly acid loamy soils*'

Site Investigations

A Phase 2 Ground Investigation Report has been produced by Wardell Armstrong in November 2018 (reference: ST15986/RPT-002/Final). Site investigations comprised 3no. rotary cored boreholes (BH4-6) advanced to a maximum depth of 15.3m.bgl and 1no. groundwater monitoring standpipe. The ground conditions identified were generally consistent across all boreholes and comprised clay, sandstone and mudstone. Siltstone was also identified within BH5 at approximately 8m.bgl.

Groundwater was recorded in the upper sandstone layer within BH5. A borehole location plan is included in Appendix C for reference.

Development Proposals

The proposed development is for a clay quarry extension. Site operations will be consistent with the existing quarry, which includes clay extraction followed by infilling with engineering material prior to restoration to agricultural pasture.

The quarry is divided into 2no. development phases. The Phase 1 extraction area covers 4,194m² and Phase 2 extraction area covers 6,066m².

Information from the Client suggests that proposed quarry excavations will reach a maximum depth of 15m.bgl.

Proposed development plans are included Appendix D.

Planning Policy

The Kirklees Council Local Plan (adopted February 2019) contains the following policies relating to drainage:

'Policy LP28 - Drainage

The presumption is that Sustainable Drainage Systems (SuDS) will be used to assist in achieving the following on each site:

- a. for proposals on greenfield sites, typical greenfield run-off rates should not be exceeded;*
- b. for proposals on brownfield sites there should be a minimum 30% reduction in surface water run-off where previous positive surface water connections from the site can be proven. New connections will be subject to*

at least greenfield restrictions;

c. No negative impact on local water quality and improvements in water quality where practicable;

d. Consider whether proposed open spaces and green infrastructure within sites can contribute to the sustainable drainage of the site’.

Consultation

A consultation request was submitted to the Lead Local Flood Authority in June 2022. A response is awaited.

Surface Water Management

The proposed development is for a quarry extension. Proposals include clay extraction and infilling with engineering material prior to restoration.

Surface water runoff from the existing Peace Wood Quarry, north of the site, is served by a drainage ditch which conveys flows to a series of ponds including attenuation and sediment settlement ponds. Outfall from the ponds is made to Baildon Dike north of Peace Wood Quarry. A surface water drainage plan of the existing quarry is included in Appendix E.

The proposed drainage scheme will emulate the existing drainage system and will comprise:

- Ditch(es) to collect runoff.
- A pumped system will collect runoff from the ditches and direct it to an attenuation pond, which will be sized to accommodate the 1 in 30 year plus 25% CC storm event. A new attenuation pond will be provided, or alternatively, where possible, the existing attenuation pond serving Peace Wood Quarry will be utilised and modified to serve the development.
- Storm events in excess of the 1 in 30 year plus 25% CC storm event (i.e 1 in 100 year) will be permitted to produce temporary shallow depth flooding within the quarry void.
- The attenuation pond will discharge at a limited greenfield rate (via a flow control device) to a settlement pond. A new settlement pond will be provided, or alternatively, where possible, the existing settlement pond serving Peace Wood Quarry will be utilised and modified to serve the development.
- The settlement pond will discharge to Baildon Dike.

This Drainage Strategy sets out the size of each element of the surface water management system.

Runoff Rates

In order to inform the limited discharge rate and sizes of the proposed ditch(es), greenfield runoff rates have been estimated using the ICP SUDS method within MicroDrainage. A summary of the greenfield runoff rates for a range of events is provided as Appendix F.

Phase 1

The 1 in 1 year greenfield runoff rate for the extraction area is 0.9 l/s. The 1 in 30 year greenfield runoff rate is 1.8 l/s. The 1 in 100 year greenfield runoff rate is 2.2 l/s.

Phase 1 & 2

The 1 in 1 year greenfield runoff rate for the extraction area is 2.2 l/s. The 1 in 30 year greenfield runoff rate is 4.3 l/s. The 1 in 100 year greenfield runoff rate is 5.3 l/s.

Sizing of the ditches

Drainage ditches will be placed at the perimeter of the quarry void to convey runoff to a sump point which will pump runoff to an attenuation pond outside of the quarry void. The drainage ditches will be sized to accommodate peak flows during the 1 in 30 year plus 25% climate change event.

The size of the drainage ditches has been estimated using the Chezy-Manning formula. The ditch sizing calculations are provided as Appendix G. The ditch(es) should be sized to accommodate 2.25 l/s during Phase 1 and 5.38 l/s during Phase 1 & 2.

Phase 1

The 1 in 30 year greenfield runoff rate is 1.8 l/s. With 25% climate change (CC) applied, the runoff rate is estimated at 2.25 l/s.

The ditch(es) will be excavated as open trapezoidal channels. A 0.3m deep ditch with a minimum base width of 0.1m, a top width of 0.7m and 1:1 side-slopes will accommodate up to 143.4 l/s. A Manning's coefficient of 0.029 has been used to represent a clean, straight, full stage natural channel with no pooling. A minimum ditch gradient of 1 in 52.86 has been utilised in the calculations, based on proposed site levels and gradients.

Phase 1 & 2

The 1 in 30 year greenfield runoff rate is 4.3 l/s. With 25% climate change (CC) applied, the runoff rate is estimated at 5.38 l/s.

The ditch(es) will be excavated as open trapezoidal channels. A 0.3m deep ditch with a minimum base width of 0.1m, a top width of 0.7m and 1:1 side-slopes will accommodate up to 181.5 l/s. A Manning's coefficient of 0.029 has been used to represent a clean, straight, full stage natural channel with no pooling. A minimum ditch gradient of 1 in 33 has been utilised in the calculations, based on proposed site levels and gradients.

Sizing of the attenuation pond

The attenuation pond has been sized using MicroDrainage. MicroDrainage storage estimates for the 1 in 30 year plus 25% CC storm event and 1 in 100 year plus 25% CC storm event are included in Appendix H.

A coefficient value of 0.75 has been utilised within the attenuation storage estimate and represents 75% of all rainfall falling within the quarry void entering the ditches and subsequently the attenuation pond. The remaining 25% of rainfall will be lost through limited infiltration and evaporation.

Phase 1

The Phase 1 extraction area covers 4,194m².

The 1 in 1 year greenfield runoff rate was estimated at 0.9 l/s which is insufficient to ensure a self-cleansing drainage system. As such, the QBAR rate has been utilised.

Based on a limited discharge rate of 1 l/s (equivalent to QBAR rate), an estimated storage volume of 268.4m³ will be required to accommodate the 1 in 30 year plus 25% CC event. An estimated storage volume of 369.2m³ will be required to accommodate the 1 in 100 year plus 25% CC event.

Attenuation is sized to accommodate the 1 in 30 year plus 25% CC storm event. Storm events in excess of the 1 in 30 year plus 25% CC storm event will be permitted to produce temporary shallow depth flooding within the quarry void. During the 1 in 100 year plus 25% CC storm event, 100.8m³ of flood storage is required within the quarry void.

Phase 1 & 2

The Phase 1 & 2 extraction area covers 10,260m².

Based on a limited discharge rate of 2.2 l/s (equivalent to the 1 in 1 year greenfield runoff rate), an estimated storage volume of 677.3m³ will be required to accommodate the 1 in 30 year plus 25% CC event. An estimated storage volume of 928.9m³ will be required to accommodate the 1 in 100 year plus 25% CC event.

Attenuation is sized to accommodate the 1 in 30 year plus 25% CC storm event. Storm events in excess of the 1 in 30 year plus 25% CC storm event will be permitted to produce temporary shallow depth flooding within the quarry void. During the 1 in 100 year plus 25% CC storm event, 251.6m³ of flood storage is required within the quarry void.

Sizing of the sediment pond

A sediment pond is proposed to reduce the sediment load of the water discharged from the site to Baildon Dike and therefore reduce the risk of potential pollution by suspended solids.

The guidance contained within the 'Sizing of surface water management systems at landfill sites' has been used to estimate the size of the sediment pond:

$$A = Q/u_s$$

Where:

A is the calculated area of the settlement pond (m²)

Q is the flow rate through the settlement pond (m³/s)

u_s is the settlement velocity of a particle (m/s)

The u_s value is taken from the guidance contained within the 'Sizing of surface water management systems at landfill sites' as 1 x 10⁻⁵ m/s. The guidance also suggests a minimum pond depth of 1m in order to provide sufficient depth to minimise erosion of the base of the pond and resuspension of settled sediment.

Phase 1

Based on a proposed incoming flow rate of 1 l/s (0.001 m³/s), equivalent to the QBAR rate, and a settlement velocity of 1 x 10⁻⁵ m/s, an estimated sediment pond surface area of 100m² will be required.

Phase 1 & 2

Based on a proposed incoming flow rate of 2.2 l/s (0.0022 m³/s), and a settlement velocity of 1 x 10⁻⁵ m/s, an estimated sediment pond surface area of 220m² will be required.

Maintenance

Maintenance of the drainage features will be the responsibility of the site owner. The proposed design should ensure safe and easy access for maintenance and repair over the lifetime of the surface water management system. Maintenance should include regular inspection and arrangements for periodic removal of silt from the sediment pond. All ditches should be regularly inspected to ensure that they are free from obstructions to maintain the designed efficiency and capacity.

Other Considerations

Flows from the quarry void will be pumped to an attenuation pond. In order to reduce the risk of flooding in the event of plant or power failure, the quarry void should be excavated as to direct flood flows to a designated low point (sump).

Provision of standby pumps, an automated pump exercise regime and a pump failure alarm system would limit the risk of pump failure.

Conclusions

The proposed development is for a clay quarry extension at Peace Wood Quarry. Site operations will be consistent with the existing quarry, which includes clay extraction to depths of up to 15m.bgl followed by infilling with engineering material prior to restoration to agricultural pasture.

The development will be divided into Phase 1, which covers an area of approximately 4,194m², and Phase 1 & 2 which covers an area of approximately 10,260m².

Runoff from the quarry void will be discharged to Baildon Dike at the northern boundary of the existing Peace Wood Quarry at the limited discharge rate of 1 l/s for Phase 1 (equivalent to QBAR rate) and 2.2 l/s for Phase 1 & 2 (equivalent to the 1 in 1 year greenfield runoff).

The proposed drainage system will comprise:

- Drainage ditch(es) on the perimeter of the quarry void to collect runoff. The ditch(es) will be excavated as open trapezoidal channels and will be no less than 0.3m deep with a base width 0.1m, a top width 0.7m and 1:1 side-slopes. This will ensure the ditch(es) can accommodate flows during a 1 in 30 year plus 25% CC event.
- Flows from the ditch(es) will be directed to a sump point and pumped to an attenuation pond. The attenuation pond will be sized to accommodate storm events up to and including the 1 in 30 year plus 25% climate change event. An estimated attenuation volume of 268.4m³ is required for Phase 1 and an attenuation volume of 677.3m³ is required for Phase 1 & 2.
- Storm events in excess of the 1 in 30 year plus 25% CC storm events (i.e 1 in 100 year) will be permitted to produce temporary shallow depth flooding within the quarry void.
- A sediment pond will be placed downstream of the attenuation pond to reduce the sediment load of the water discharged from the site to Baildon Dike. An estimated sediment pond area of 100m² is required for Phase 1 and 220m² is required for Phase 2. The sediment pond depth should be a minimum of 1m.
- Discharge to Baildon Dike will be made at a limited rate of 1 l/s during Phase 1 and 2.2 l/s during Phase 1 & 2.

The drainage system will provide surface water runoff reduction and sediment control, both in the short term i.e during extraction works and also the long term following completion of the restoration works.

A Concept Designer's Risk Assessment (cDRA) has been prepared to inform future designers of any identified hazards associated with the scheme. The cDRA has been included in Appendix I.

Recommendations

1. Submit this Drainage Strategy to the Planning Authority in support of the Planning Application.

Model Details

Storage is Online Cover Level (m) 10.000

Tank or Pond Structure

Invert Level (m) 8.000

Depth (m)	Area (m ²)	Depth (m)	Area (m ²)
0.000	135.0	2.000	135.0

Hydro-Brake® Optimum Outflow Control

Unit Reference	MD-SHE-0040-1000-2000-1000
Design Head (m)	2.000
Design Flow (l/s)	1.0
Flush-Flo™	Calculated
Objective	Minimise upstream storage
Application	Surface
Sump Available	Yes
Diameter (mm)	40
Invert Level (m)	7.995
Minimum Outlet Pipe Diameter (mm)	75
Suggested Manhole Diameter (mm)	1200

Control Points	Head (m)	Flow (l/s)
Design Point (Calculated)	2.000	1.0
Flush-Flo™	0.173	0.6
Kick-Flo®	0.355	0.5
Mean Flow over Head Range	-	0.7

The hydrological calculations have been based on the Head/Discharge relationship for the Hydro-Brake® Optimum as specified. Should another type of control device other than a Hydro-Brake Optimum® be utilised then these storage routing calculations will be invalidated

Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)

Model Details

Storage is Online Cover Level (m) 10.000

Tank or Pond Structure

Invert Level (m) 8.000

Depth (m)	Area (m ²)	Depth (m)	Area (m ²)
0.000	339.0	2.000	339.0

Hydro-Brake® Optimum Outflow Control

Unit Reference	MD-SHE-0060-2200-2000-2200
Design Head (m)	2.000
Design Flow (l/s)	2.2
Flush-Flo™	Calculated
Objective	Minimise upstream storage
Application	Surface
Sump Available	Yes
Diameter (mm)	60
Invert Level (m)	7.995
Minimum Outlet Pipe Diameter (mm)	75
Suggested Manhole Diameter (mm)	1200

Control Points	Head (m)	Flow (l/s)
Design Point (Calculated)	2.000	2.2
Flush-Flo™	0.262	1.5
Kick-Flo®	0.534	1.2
Mean Flow over Head Range	-	1.6

The hydrological calculations have been based on the Head/Discharge relationship for the Hydro-Brake® Optimum as specified. Should another type of control device other than a Hydro-Brake Optimum® be utilised then these storage routing calculations will be invalidated

Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)
0.100	1.3	1.600	2.0	5.000	3.4

Appendix I Concept Designer's Risk Assessment

Project: Peace Wood Quarry, Huddersfield
Client: The Mineral Planning Group Ltd
Report Reference: 14760-Drainage Strategy-02

Project No: 14760

Prepared by:	Megan Williams	Date:	16/12/2022
Checked by:	Jordan Jones	Date:	19/12/2022
Reviewed by:	Alun Roberts	Date:	20/12/2022

Requirement:

The Construction (Design and Management) Regulations 2015 (CDM 2015) place an obligation on the Designer to take all reasonable steps to provide, with the design, sufficient information about the design, construction or maintenance of the structure, to adequately assist the client, other designers and contractors to comply with their duties under CDM. The Designer has undertaken this assessment to identify any extra-ordinary risks, or those that would not be expected on this particular project by an experienced and competent Contractor. The aim is to avoid needless paperwork and bureaucracy and ensure the assessment is project specific, relevant and proportionate to the risk.

DRA Summary

Each of the following risk areas has been considered using the question below. Is a risk present which is considered to be **extra-ordinary or unexpected** in this instance?

If **YES** - A detailed risk assessment is required at design stage

If **UNKNOWN** - Insufficient information has been provided at concept design stage and the risks are unknown. Further consideration must be given at design stage(s)

If **NO** - No further action is required.

Hazard Ref.	Risk Areas	YES, UNKNOWN or NO	Comments
1	Ground Conditions	Unknown	To be confirmed at detail design stage
2	Hazardous Environment	Unknown	To be confirmed at detail design stage
3	Existing Working Environment	Yes	Existing quarry north of the site
4	Existing Services	Unknown	To be confirmed at detail design stage
5	Proximity to Other Structure(s)	Yes	Existing quarry north of the site
6	Near Waterbody / flood risk	Yes	Nicholas Spring east of the site & Baildon Dike north of existing quarry
7	Proximity to Other Activities	Yes	Existing quarry north of the site
8	Sequence of Construction	Unknown	To be confirmed at detail design stage
9	Access	Unknown	To be confirmed at detail design stage
10	Interfaces	Unknown	To be confirmed at detail design stage
11	Confined Space Working	Unknown	To be confirmed at detail design stage
12	Maintenance Considerations	Unknown	To be confirmed at detail design stage
13	Working at Height	Unknown	To be confirmed at detail design stage
14	Steep Slopes	Unknown	To be confirmed at detail design stage
15	Demolition / Refurbishment / Repair	Unknown	To be confirmed at detail design stage
16	Welfare	Unknown	To be confirmed at detail design stage
17	Occupational Health	Unknown	To be confirmed at detail design stage
18	Environmental Issues	Unknown	To be confirmed at detail design stage
19	Other Significant Hazards not Identified Above	Unknown	To be confirmed at detail design stage
20	Residual Risk to Future Users	Unknown	To be confirmed at detail design stage
