Assessment

No ecological information has been submitted along with the application; therefore, the assessment of the ecological impacts is based on the limited information available. The site is located within the bat alert zone and within close proximity to the records of roosting bats. Therefore, as the surrounding area provides suitability for bats and the proposals include for works to the structure of the building, there is a reasonable likelihood of disturbance to roosting bats. In addition to the above, the site is located within close proximity to records of great crested newt. Although unlikely that suitable terrestrial habitat will be impacted by the proposed development, construction related activities could, and therefore, information should be provided in order to ensure that impacts are adequately addressed.

The government circular on Biodiversity and Geological Conservation (ODPM, 2005) and explanatory note from Natural England (Natural England, 2020) indicates that information of protected species, and in particular European protected species (including bats), should be made available prior to determination.

Advice to planning officer

The applicant should engage with a suitably qualified ecologist to undertake a daytime inspection for bats (also known as a Preliminary Roost Assessment or Bat Scoping Survey). In many cases this will be adequate to determine whether bats are likely to be affected. If the survey indicates that further activity surveys are required to determine the presence/likely absence of bats, this information should also be supplied. Bat activity surveys should be carried out between May and August and in accordance with Bat Conservation Trust guidelines (Collins, 2023). The appointed ecologist should also consider the sites suitability for great crested newts.

The application should not be determined prior to obtaining survey information regarding bats.
