## Client Brief and Scope of Works

We have been instructed to prepare structural calculations for a reinforced concrete retaining wall along with drawing of a typical section through that wall.

We have visited the site on 12<sup>th</sup> May and viewed there to be good natural ground at the formation level and we have adopted a conservative safe bearing capacity of 150kN/m<sup>2</sup>. The client had already purchased reinforcing bars in the form of A393 mesh and H12 straights. Our brief was to propose a solution using this reinforcement – refer to the attached calculations.

These calculations should be submitted to the appointed Building Control Company for Building Regulation approval prior to the commencement of work on site.

Where relevant, for items of work listed above, a design philosophy specifying design parameters and assumptions is included at the start of the calculations.

## Temporary Works

Temporary works design, installation and construction sequence are the sole responsibility of the contractor.

## Construction, Design and Management Regulations (CDM) 2015

Under CDM 2015 designers are duty bound to provide adequate information about any significant risks associated with the design project.

The structural concept and form of construction of the proposed works are conventional and as such the designs are deemed to have reduced foreseeable risk to an acceptable level. The level of risk is normal for this type of project and would be obvious to a competent contractor.
