Executive Summary

Site Location	The site comprises the former Kirklees College campus to the west of Huddersfield Town Centre. It is centred on approximate Ordnance Survey National Grid Reference 414068E, 416825N with an indicative postcode of HD1 5NN.
Development Proposals	The proposed scheme involves the construction of a new retail structure in the eastern section of the site, with car parking to the west. A new access will be created to the south-west from Trinity Street.
Ground Conditions	Ground conditions encountered during the intrusive investigation generally confirm those identified in the published literature and previous reports and in summary comprise Made Ground locally underlain by Head Deposits and elsewhere or beneath the Made Ground by Pennine Lower Coal Measures strata (PLCM) which include worked coal seams.
Site Preparation	Demolition materials, including all asphalt/concrete hardstanding and below ground foundations removed as part of the clearance work, subject to appropriate sorting and crushing, would be suitable for re-use as bulk fill beneath hard cover areas. Although not considered to be significant any topsoil removed during site preparatory works and considered for re-use should be stockpiled separately from other materials and protected from inclement weather for future use in landscaped and garden areas subject to confirmatory laboratory testing.
Shallow Mine Workings	The risk of surface instability resulting from ground movement associated with collapse of abandoned shallow mine workings is considered to be low beneath the currently proposed building location with specific remedial measures required.
Mine Shafts	During the demolition of the former structures and removal of the slabs, a possible brick lined mine shaft was encountered close to the south-eastern site boundary. Groundwater was standing within the shaft at approximately 14.50mbgl, but the depth of the feature could not be accurately determined. The Client has employed a specialist driller and remediation specialist to investigate and remediate the potential mine shaft under the appropriate Coal Authority Licence. This is being undertaken independently to this report.
Foundations and Floor Slabs	It is anticipated that the made ground would be amenable to treatment by vibro-compaction to achieve a relatively consistent state of compaction throughout. Under such circumstances, a minimum net allowable bearing pressure of 150kN/m2 is anticipated. Although this should be confirmed by consultation with a reputable specialist contractor. The floor slab can be ground bearing where fully supported on engineered granular fill which has been compacted to an appropriate specification. Floor slabs would need to be reinforced.
Pavements and Hardstanding	Earthworks are to comprise the formation of a development plateau using either 6F2 or 6F5 where required to achieve a California Bearing Ratio (CBR) of 5% (when measured in accordance with BS 1377: Soils for civil engineering purposes: Part 4 at a formation level of 450mm below the proposed finished levels of external hardstanding.
Concrete Classification	The typical design sulphate (DS) class and "Aggressive Chemical Environment for Concrete" (ACEC) class for the site are DS-2 and AC-2z respectively.
Soakaways	In consideration of the thickness of Made Ground and cohesive nature of the natural soils beneath the site, soakaways are not considered a feasible drainage option.
Ground Gas	The site is indicated to classify as Characteristic Gas Situation (CS) 1 – Very Low Gas Risk' in accordance with BS8485:2015. Therefore, no specific gas protection measures are considered necessary.
Contamination Assessment	In consideration of the chemical test results, it is concluded that the site does not contain any significant and/or widespread contamination sources. Risks to controlled waters are also considered to be low with no remedial actions required.
Waste Disposal	On the basis of the current information it is likely that the majority of excavated soil would

	be classified as Non-hazardous or even Inert with natural deposits classified as Inert for landfill disposal. This would need to be confirmed by further analysis of bulk soils destined for disposal under consultation with the landfill operator.
Potable Water Supplies	The requirement for specific materials and measures to protect the water supply from ground contamination is not envisaged, but would need to be confirmed with the utilities provider.
Colliery Spoil	Although not anticipated in significant quantities, any colliery spoil encountered during inspection following the site strip should be removed where it will potentially interact with new building foundations and floor slabs.

CONTENTS

APPENDICES

1.0 INTRODUCTION

Appointment

1.1 WML Consulting was commissioned by Stainforth Construction to undertake a Phase 2 Geo-environmental Investigation and Assessment of a site referred to as Trinity Street, Huddersfield.

Proposed Development

1.2 The proposed scheme involves the construction of a new retail structure in the eastern section of the site, with car parking to the west. A new access will be created to the south-west from Trinity Street.

1.3 The structure and external hardstanding will be surrounded by soft amenity landscaping comprising grassed and planted areas.

1.4 The current proposed development and landscape drawing is presented in Appendix 01.

Objective

1.5 The objective of the ground investigation and assessment was to provide geotechnical recommendations for construction design purposes together with a geo-environmental risk assessment in terms of possible ground contamination.

1.6 To achieve the objective, the following tasks were undertaken:

- Review the existing desk study report for the site and design a Phase 2 Ground Investigation.
- Characterise the ground conditions in terms of geology, soil geotechnical parameters and ground contamination from information provided by the ground investigation.
- Provide recommendations regarding suitable foundations together with any other geotechnical considerations that could affect possible future development.
- Determine a ground conceptual model for the site so as to undertake a ground contamination Generic Quantitative Risk Assessment (GQRA).

Scope

1.7 A Phase 1 Desk Study for the site has been undertaken by WML and is presented in the following report:

- Phase 1 Desk Study and Preliminary Phase 2 Geoenvironmental Assessment, Reference 7344/G/01, dated January 2017.

1.8 It should be noted that the Phase 1 report was for the larger former college site, whereas this report provides information associated with the current phase of development in the southern half of the larger site only.

1.9 This report includes the findings of the pre and post demolition Phase 2 Ground Investigations designed on conclusions and recommendations within the Phase 1 Desk Study. For ease of reference, the findings of the Desk Study are summarised in the following sections. However, the two reports are not exclusive and should be read in conjunction.

1.10 The pre demolition investigations were undertaken by Ian Farmer Associates (on behalf of WML Consulting) and post demolition investigations by Groundtech Consulting and WML and are supplemented where required by an investigation undertaken by Soil Mechanics for WML in 2006.

1.11 The pre and post demolition rotary drilling to determine the presence of suspected abandoned mine workings was undertaken under relevant Coal Authority Permits in accordance with the HSE Guidance on Managing the Risk of Hazardous Gases when "Drilling or Piling Near Coal" and CIRIA Special

Publication 32:2002 "Construction Over Abandoned Mine Workings" (pre-demolition) and for the 2023 investigations C758D - 2019 "Abandoned mine workings manual" (post-demolition).

1.12 The ground investigation comprised the formation of window sample probeholes undertaken with reference to BS5930:2015 + A1:2020 Code of Practice for Ground Investigation and BS10175:2011 together with A2:2017, "Investigation of Potentially Contaminated Sites - Code of Practice" except where superseded by EN ISO 22475-1 "Geotechnical Investigation and Assessment – Sampling by Drilling and Excavation and Groundwater Measurements".

1.13 Geotechnical soil testing was undertaken in general accordance with guidelines provided in BS1377:1990 – Parts 1-9, "Method of Test for Soils for Civil Engineering Purposes". Samples for chemical analysis were obtained and handled generally in accordance with the current guidelines (BS10175: 2011 and A2:2017).

2.0 SITE LOCATION AND DESCRIPTION

Site Location

2.1 The site comprises the southern half of the former Kirklees College campus to the west of Huddersfield Town Centre. It is centred on approximate Ordnance Survey National Grid Reference 414068E, 416825N with an indicative postcode of HD1 5NN.

2.2 The site is bounded to the north by the larger former college site and a Grade II listed building, to the east by Castlegate. It is bounded to the south and west by Trinity Street.

2.3 A location plan, with the subject site as the black and white, unshaded area, presented in Appendix 01, on drawing referenced WIP280520 by Enjoy Design.

Site Description

2.4 The site is irregular in shape and is very approximately 1.15 hectares in plan area.

2.5 Until the recent demolition in late 2022/early 2023 the majority of the site was developed with structures of varying ages, heights and construction associated with their former use as Huddersfield Technical College.

2.6 Localised areas of landscaping were located within the eastern and southern sections of the site and comprise mainly grass and low-lying vegetation with localised trees of varying species.

2.7 During the post-demolition site investigations in 2023, the structures, floor slabs and foundations had all been demolished/cleared and the construction material was in the process of being crushed for re-use, under control of the earthwork's contractor. The northern section of the site appeared to be in use as a site compound.

2.8 During demolition a circular feature was encountered by the Contractor within the south-eastern section of the site, which was reported to be 2.00m in diameter and lined with brick/stone. Standing water was noted within the feature to be around 14.50mbgl. This is further discussed in Section 3.0 and has been considered likely to represent a potential mine shaft.

2.9 The surrounding land is predominantly occupied by mixed commercial and residential development. A pedestrian subway provide access beneath Castlegate immediately south-east of the site boundary.

2.10 Photographs of the site post demolition are provided in Appendix 02.

Topography

2.11 Prior to demolition activities the site sloped to the south-west with site elevations reducing from around 114.90m Above Ordnance Datum (AOD) in the north-western section of the larger former college site to around 104.70m AOD close to the south-eastern site boundary, adjacent to the access to the Castlegate pedestrian subway.

2.12 The changes in elevation were accommodated by a series of retaining walls of varying construction, concrete steps or gentle grassed and hardstanding slopes.

3.0 SUMMARY OF ENVIRONMENTAL AND HISTORICAL SETTING

3.1 The following paragraphs summarise the most relevant findings of the Phase 1 desk study report.

Geology

3.2 No Made Ground is recorded beneath the site although is likely to be present at least in part due to the previous development history.

3.3 The BGS plans indicated that drift deposits are absent beneath the majority of the site area with the exception of Head Deposits which are inferred to exist beneath the eastern and south-eastern sections. The Head Deposits are indicated to generally comprise interbedded silt, clay, sand and gravel.

3.4 Elsewhere and beneath the Head deposits the site is underlain by the Carboniferous Middle Bank Rock of the Lower Pennine Coal Measures (PLCM). This is indicated to comprise thinly bedded rubbly sandstone. This is underlain by undifferentiated PLCM strata mainly comprising interbedded grey mudstone, siltstone and pale grey sandstone with numerous coal seams.

3.5 The Soft Bed Coal is inferred to sub-crop to the north, east and south of the site approximately 500m west at its closest point. The BGS plans infer that the Soft Bed Coal is around 0.80m in thickness within the general site area. Therefore, as the solid strata are indicated to dip to the east at an angle of approximately 2°, the seam could occur at a relatively shallow depth beneath the subject site.

3.6 BGS archive borehole record SE11NW476 located some 10m south-west of the site encountered Made Ground to a depth of 1.45 metres below ground level (mbgl) underlain by 'stiff, brown clay' to a depth of 5.31mbgl and in turn by 'dark grey shale' with the borehole terminating at 7.00mbgl. In the wider area, records indicate potential mine workings / voids of approximately 0.95m in thickness at depths of around 19.00mbgl.

Radon

3.7 The property is not in a Radon Affected Area as defined by the UK Health Security Agency as less than 1% of properties are above the Action Level of exposure. Therefore, no radon protection measures are necessary for new structures as described in publication BR211 by the Building Research Establishment.

Mining and Subsidence

3.8 The Coal Authority report states that the property is not within the likely zone of influence from recorded past underground workings. However, the Authority also states that the property is in an area where coal is at or close to the surface and that this coal may have been worked at some time in the past.

3.9 Notwithstanding this, no notice of the risk of the land being affected by subsidence has been given under the Coal Mining Subsidence Act 1991 and the Authority has not received a damage notice or claim for the subject property, or other property within 50m, since records began in 1994.

3.10 The property has not been subject to remedial works, by or on behalf of the Authority, under its Emergency Surface Hazard Call Out Procedure.

3.11 The Coal Authority Interactive viewer has indicated that the site is within a 'Development High Risk' area and in an area of 'probable shallow mine workings'.

3.12 The Coal Authority does not indicate that there are any mine shafts on site or within 20m of the site. However, during demolition a circular feature was encountered by the Contractor within the south-eastern section of the site, which was reported to be around 2.00m in diameter and lined with brick/stone. Groundwater was noted within the feature to be around 14.50mbgl. In order to ascertain

the nature and risk associated with this, the Client is currently employing a specialist driller and remediation specialist to investigate and remediate the potential mine shaft under the appropriate Coal Authority licence. This is being undertaken independently to this report.

Environmental Setting

3.13 The Head Deposits indicated to be present in the south-eastern section of the site are classified as a Secondary (formerly an Undifferentiated) Aquifer.

3.14 The underlying Middle Band Rock is classified as a Secondary (A) Aquifer (formerly Minor Aquifer). These include permeable layers capable of supporting water supplies at a local rather than at a strategic scale, and in some cases forming an important source of base flow to rivers.

3.15 There are no Environment Agency Source Protection Zones within 500m of the site.

3.16 There are no Detailed River Network Features within 500m of the site. The nearest surface water feature is a pond located some 227m to the north and therefore beyond the influence of the site.

3.17 There are no active Surface Water Abstraction Licences recorded within 500m of the site. Those at greater distance are not considered to be within influencing distance of the site.

3.18 There are no historical or active landfills within 500m of the site.

3.19 There are no licensed Waste Sites within 250m of the site. The nearest is located around 407m east and relates to household, commercial and industrial waste types.

Site History

3.20 In summary, the central section of the site had been developed as part of the larger Huddersfield Infirmary with a Timber Yard prior to the first available map of 1854. The southern sections of the site underwent residential development sometime prior to 1893. By 1959 the Timber Yard had been replaced with two unspecified Works. In the 1970's the site had been redeveloped as Huddersfield Training College, with the former Infirmary buildings retained and new structures constructed in the southern section of the site.

3.21 The historical use of the site as an Infirmary and a Timber Yard in the southern area is unlikely to have given rise to a significant degree of ground contamination although localised contamination sources are likely to be present as confirmed by previous ground investigations.

Preliminary Contamination Risk Assessment

3.22 Under the proposed development scenario, potential pollution linkages were on the whole considered unlikely with associated preliminary risks being assessed, on the whole, as low.

3.23 However, a moderate risk was assessed in relation to possible mine gas, particularly where potential lines of weakness in the solid strata such as unrecorded mine shafts may form a pathway for upward migration.

3.24 Uncertainties relating to the presence of ACM and asbestos fibres within the Made Ground as a result of previous unrecorded demolition and the potential, albeit for localised sources of ground contamination were also considered possible.

4.0 PREVIOUS GROUND INVESTIGATIONS

4.1 A review of both the WML records and Kirklees Council Planning Portal indicates that two ground investigation reports and a Coal Authority Risk Assessment have previously been undertaken on the site, namely:

- Report on Ground Investigation by Soil Mechanics on behalf of Huddersfield Technical College, reference A6111/1, dated October 2006.
- Phase 1 Geo-Environmental desk Study by Clancy Consulting Engineers on behalf of Wiggett Construction Limited, reference 10/0801/002, dated November 2015.
- Coal Mining Risk Assessment Report by Clancy Consulting Engineers on behalf of Wiggett Construction Limited, reference 10/0801/002, dated December 2015.
- Geo-Environmental Appraisal Report by Clancy Consulting Limited on behalf of Wiggett Construction, reference 10/0801/003, dated April 2016.

4.2 Information contained within the reports has been reviewed so as to supplement the findings of this current report. However, the information has not been reproduced within this report with the exception of relevant excerpts of the factual Soil Mechanics (2006) report undertaken for WML Consulting.

Soil Mechanics - 2006

4.3 The Soil Mechanics investigation comprised the formation of 10no window sample probeholes and 6no rotary cored boreholes together with chemical analysis, geotechnical testing and ground gas monitoring with BH3 to BH5 and WS6 to WS10 within the subject site.

4.4 In summary, the intrusive investigation indicated the majority of the wider site to be underlain by Made Ground extending to depths of between 0.35m and 4.25mbgl.

4.5 The Made Ground generally comprised asphalt hardstanding, concrete paving or stone cobbles underlain by a granular sub-base, or locally sandy, gravelly topsoil. These surface horizons of Made Ground were underlain by clayey gravelly sand and sandy gravel with cobbles of sandstone and brick. Gravel sized fragments generally comprised sandstone, brick, coal and locally concrete, bitumen, clinker, slag, glass, pottery, metal and wood.

4.6 The Made Ground was generally underlain by strata considered to represent Superficial Deposits extending to depths of between 1.00m and 4.80mbgl. The Superficial Deposits generally comprised variably sandy and gravelly clay, locally with cobbles.

4.7 The Made Ground or Superficial Deposits, where present, were in turn underlain by Pennine Lower Coal Measures (PLCM) at depths of between 0.20m and 4.80mbgl, extending to a maximum proven depth of 21.83mbgl. The PLCM strata comprised interbedded sandstone, siltstone and mudstone.

4.8 An intact coal seam of 0.40m in thickness was encountered beneath the subject site at a depth of 13.70mbgl. However, voids and loose ground were encountered within the larger former college site at depths of between 16.70m and 18.30mbgl. The voids were generally between 0.10m and 0.40m in thickness. Within BH1 and BH3 the voids were underlain by between 0.90m and 1.80m of 'loose ground' suggesting that possible collapse and upward migration of the workings had occurred.

4.9 Standing groundwater was recorded across the wider site area at depths of between 2.50m within the Superficial Deposits and between 13.00m and 20.00mbgl within the underlying PLCM.

4.10 Chemical analysis results indicated elevated concentrations of total Polyaromatic Hydrocarbons (PAH) and Total Petroleum Hydrocarbons (TPH) (500mg/kg of Mineral Oil) within a single sample of shallow Made Ground in the south-eastern section of the subject site.

4.11 During the wider site investigations, ground gas monitoring recorded slightly elevated concentrations of methane up to 1.1% by volume in air (v/v) and slightly elevated concentrations of carbon dioxide up to 3.8%v/v. No significant gas flow rates were recorded.

4.12 Relevant excerpts of the report are reproduced in Appendix 03.

Clancy Phase 1 Desk Study – November 2015

4.13 In 2015 Clancy undertook a desk study for the larger site area with the subject site to comprise a supermarket.

4.14 The report identified potential contamination sources, pathways and receptors and recommended that intrusive investigations be carried out to establish the ground profile and chemical constituents of the soil together with in situ testing to provide adequate recommendations for foundation design.

4.15 The report also recommended that a Coal Mining Risk Assessment be carried out in order to further assess the risk from shallow mine workings and to establish whether an intrusive mining investigation was required.

Clancy Coal Mining Risk Assessment Report – December 2015

4.16 Subsequently Clancy undertook a Coal Mining Risk Assessment which included a review of BGS maps and archive boreholes together with a Coal Authority Mining Report. The report also included a review of local archives together with information provided by a local mining historian.

4.17 The report makes no mention of the Soil Mechanics report suggesting that this was not available for their review at the time.

4.18 The anecdotal information referred to in the report indicated that much of Huddersfield Town Centre, including areas in close proximity to the site, are underlain by unrecorded shallow mine workings.

4.19 Unverified historical boreholes relating to nearby previous developments provided to Clancy indicated shallow bedrock with voids of up to 0.90m in thickness located at depths of approximately 19.00mbgl.

4.20 The report also referred to anecdotal information suggesting that coal/fireclay extraction may have occurred beneath the larger college site (i.e. north of the subject site) together with the possible presence of a '5 yard' (4.6m) deep shaft which was used for disposal of refuse/waste from the hospital. The presence or location of the shaft is, however unsubstantiated but inferred to be located to the north of the subject site.

Clancy Geo-environmental Appraisal Report April 2016

4.21 This report presented and assessed the results of a site investigation within the larger site area which comprised the formation of 18no window sample probeholes to a maximum depth of 5.45mbgl. No further mining investigations were undertaken as part of the investigation.

4.22 In summary, the intrusive investigation indicated the majority of the larger site to be underlain by Made Ground extending to depths of between 0.10m and 4.10mbgl. The Made Ground was locally underlain by Superficial Deposits to depths of up to 3.20mbgl, and in turn beneath the subject site area, by the weathered Pennine Lower Coal Measures mainly comprised weathered mudstone to a maximum proven depth of 5.45mbgl.

4.23 Limited ground gas monitoring recorded no methane and slightly elevated concentrations of carbon dioxide, up to 1.1%v/v. No significant flow rates were recorded.

5.0 SITE INVESTIGATION

Rationale

5.1 Phased intrusive investigations were undertaken to detail the presence of unrecorded shallow mine workings beneath the site and to verify the preliminary site conceptual model and clarify the low environmental risk.

5.2 The investigations comprised phased pre-demolition rotary boreholes and additional post-demolition rotary holes, targeting the building footprint, to intercept the coal seams and confirm the previous findings.

5.3 On the basis that solid strata were anticipated at shallow depth together with the restricted nature of the site, window sample probeholes were undertaken pre-demolition (2006 and also 2017) to provide general information on near surface deposits and to provide samples for chemical analysis. Due to the small diameter of the probing equipment, the depth of penetration achieved is dependent on favourable ground conditions. As such, ground penetration may be restricted in circumstances where the ground is particularly strong or contains relatively large obstructions such as cobbles and/or boulders.

5.4 Post-demolition trial pits were then undertaken at accessible locations across the site area to provide additional information and samples for chemical analyses.

5.5 The phased Investigations are listed in the table below for clarity:-

Site Investigation	Date	Rotary Boreholes	Window Samples	Trial Pits
Soil Mechanics (For WML)	2006	BH3 - BH5	WS6 – WS10	-
Ian Farmers (For WML)	2017	BH106 – BH108	WS106	-
**Groundtech Consulting (For Stainforth)	2023	RO1 – R03	-	-
**WML	2023	-	-	#TP01, TP02, TP05, TP06, TP07, TP08, TP12 & TP13 (and 3no spot samples from the proposed locations of TP09 and TP11).

Notes
**= Post-Demolition
#Numbering system was set out by the contractor and this resulted in the missing numbers being in working areas that could not be included in the trial pits.

5.6 Chemical analysis of a general suite of contaminants was undertaken on selected samples of soil with the inclusion of asbestos identification and hydrocarbon analysis on selected samples. This was to confirm the anticipated low contamination risk and to establish the chemical suitability of soils for possible re-use or disposal classification.

5.7 The investigation locations were chosen so as not to impact on the presence of known/suspected services beneath the site and also in view of the potential development options.

5.8 Monitoring standpipes were installed to the pre-demolition probeholes for the measurement of gas and groundwater.

Phased Intrusive Works

5.9 The original pre-demolition ground investigation work was undertaken in August 2006 by Soil Mechanics. Within the subject site area this comprised the formation of 5no window sample probeholes to a maximum depth of 5.00mbgl and 3no rotary open-hole and rotary cored boreholes to a maximum depth of 20.00mbgl in order to investigate the presence of shallow mine workings.

5.10 An additional phase of pre-demolition ground investigation work was undertaken between 6th and 19th January 2017 by Ian Farmer Associates (IFA). Within the subject site area this comprised the formation of 1no window sample probehole to a maximum depth of 3.45mbgl and 3no rotary open-hole boreholes to a maximum depth of 21.00mbgl in order to investigate the presence of shallow mine workings.

5.11 Post-demolition Groundtech Consulting undertook an additional 3no rotary open holes to a maximum depth of 40.00mbgl between 11th and 13th April 2023 in order to investigate the presence of shallow mine workings beneath the proposed building footprint.

5.12 Subsequently on 14th May WML undertook a series of trial pits to a maximum depth of 2.05mbgl across the general site area.

5.13 The exploratory hole records are presented in Appendix 03, 04 and 05 of this report whilst the exploratory hole locations are shown on a combined drawing referenced 7913G-SK01 in Appendix 01.

5.14 Drawing 7344G/SK-02 in Appendix 01 also includes the approximate locations of the rotary holes formed by Soil Mechanics during the 2006 investigations.

Monitoring Standpipes

5.15 Monitoring wells for groundwater and ground gas measurements were installed in 3no probeholes and 3no rotary holes within the subject site area during the 2006 and 2017 investigations. Those within the subject site are presented on the logs in Appendix 03 and 04.

Geotechnical and Chemical Testing

5.16 In-situ geotechnical testing was undertaken at regular intervals during the formation of the probeholes in the form of Standard Penetration Tests (SPTs). The results for the testing are presented on the descriptive logs.

5.17 Geotechnical testing was undertaken during the 2006 investigations for the following.

- Moisture Content
- Atterberg Limits
- Particle size distribution analyses
- Triaxial testing – Unconsolidated unconfined.

5.18 The results of the geotechnical testing are presented in Appendix 03.

5.19 Chemical analysis was undertaken on selected soil samples for the following contaminants of concern during the 2017 and 2023 investigations:

- Total Arsenic, Boron, Cadmium, Chromium VI, Copper, Lead, Mercury, Nickel, Selenium, Vanadium, Zinc.
- Total Cyanide, Phenols, Sulphur, Sulphate.
- Speciated USEPA Polyaromatic Hydrocarbons (PAH).
- Total Petroleum Hydrocarbons, BTEX, MTBE.
- Asbestos Screen and Identification.
- 2:1 water/soil sulphate extract, pH.

- Organic Matter.

5.20 The results of the chemical analyses are presented in Appendix 03 and 06.

Gas and Groundwater Monitoring

5.21 Gas and groundwater monitoring has been carried out on 6no occasions in August 2006 by Soil Mechanics and a further 4no occasions between January and February 2017. The Soils Mechanics (2006) monitoring results are presented in Appendix 03, and the Ian Farmer Associates (2017) in Appendix 07.

6.0 GROUND CONDITIONS

General

6.1 Ground conditions encountered during the intrusive investigation generally confirm those identified in the published literature and previous reports and in summary comprise Made Ground underlain by Head Deposits and in turn by the Pennine Lower Coal Measures strata (PLCM) which include worked coal seams.

6.2 The current investigation data set comprised all phases of intrusive investigations between 2006 and 2023.

Made Ground

6.3 Made Ground was encountered in the majority of the exploratory holes from ground level to depths of between 0.30m and 4.00mbgl but more generally between 0.50m and 1.60mbgl. The deeper Made Ground was encountered in the south-east of the site.

6.4 The Made Ground generally comprised a surface horizon of asphalt over granular sub-base or more locally imported topsoil. However, by the 2023 investigations this and the majority of the former concrete floor slabs had been cleared.

6.5 Beneath this the Made Ground is very variable in nature and generally comprises both cohesive and granular strata with inclusions of gravel and cobble-sized brick, concrete, sandstone and ash together with lesser constituents of wood, glass and metal.

6.6 A Natural Moisture Content measured for the cohesive made ground was record at 23% with a liquid limit of 40% and a corresponding Plasticity Indices of 15% indicated clay of low volume change potential.

6.7 A single undrained shear strength results for the cohesive Made Ground recorded 42kN/m² confirming a variable strength ranging from soft to firm.

Head Deposits

6.8 The Made Ground is underlain by a thin layer of Superficial strata considered to represent Head Deposits which extend to depths generally between 1.00m and 3.50mbgl. However, this was absent within WS7, where the greatest thickness of Made Ground was encountered.

6.9 This is generally described as firm but locally soft or stiff, sandy gravelly clay with occasional cobbles and boulders. Gravel and cobbles are described as generally sub-angular of sandstone.

6.10 Standard Penetration Test (SPT) 'N' values undertaken in the Head Deposits ranged from 5 to 34 indicating a locally very soft but generally firm and stiff consistency.

6.11 Natural Moisture Contents for the cohesive superficial deposits were in the range of 16% to 21%. Liquid limits within the range of 32% to 44% with corresponding Plasticity Indices in the range of 12% to 21% (modified to 12% to 17%) indicated clay of low to intermediate plasticity and low volume change potential.

6.12 Undrained shear strength results for the superficial deposits ranges from around 61kN/m² to 73kN/m² confirming a firm consistency.

6.13 A PSD undertaken in the granular superficial deposits recorded the sample to comprise 26% gravle, 27% sand, 23% silt and 23% clay fractions.

Pennine Lower Coal Measures (PLCM)

6.14 The Made Ground and Head Deposits are underlain by solid strata of the PLCM from depths of between 3.00m and 4.50mbgl extending to a maximum proven depth of 40.00mbgl.

6.15 The PLCM generally comprised interbedded very weak to moderately strong mudstone, siltstones and sandstones and was generally thickly laminated to thinly bedded.

6.16 However, the upper horizons are highly to completely weathered and described as either a very stiff, laminated clay with fragments of mudstone or very weak to weak laminated mudstone. The rock strength increased with depth to become very weak to medium strong.

6.17 SPT 'N' values undertaken in the upper horizons of highly weathered rock ranged from 33 to greater than 50 confirming a generally weak strength.

Coal Seams/Shallow Mine Workings

6.18 Within all of the rotary holes, with the exception of R03 (Groundtech 2023), either intact coal seams or workings were recorded.

6.19 The depths to the coal/shallow mine workings together with appropriate levels to Ordnance Datum are summarised as follows.

BH	Ground Level (m AOD) prior to any earthworks activities	Depth of Coal/Workings		Level of Coal/Workings to Ordnance Datum		Details			
						Thickness (m)		Thickness of Loose / Collapsed Workings (m)	Total Thickness
		Depth to Top (mbgl)	Depth to Base (mbgl)	Depth to Top (mAOD)	Depth to Base (mAOD)	Void	Intact Coal		
Soil Mechanics 2006									
BH3	109.60	16.70	18.80	92.90	90.80	0.30	-	1.80	2.10

Notes
*Assumed incorrect on log and therefore estimated from topographical survey.
** Assumed from site data after clearance of floor slabs and basements.

6.20 The exploratory holes on the whole confirm a general shallow easterly to south-easterly dip of the strata by approximately 2° this being consistent with the geological information recorded on the published BGS maps. The strata dip is also generally consistent with the local surface gradient.

6.21 However, the Groundtech 2023 investigations did encounter a coal seam at fairly shallow depth within the central section of the proposed building footprint. That appears to be laterally impersistent, considering the very shallow angle of dip and dip direction, as it was not encountered within BH106.

Visual/Olfactory Evidence of Contamination

6.22 No visual and/or olfactory evidence of significant ground contamination were identified within the exploratory holes within the subject site during the investigations.

Groundwater

6.23 Groundwater was only encountered during formation of the BH107 and BH108 at depths of 6.00m and 3.90mbgl within the mudstone and top of mudstone respectively.

6.24 Standing groundwater levels were recorded as perched at depths as shallow as 2.11m but generally within in the solid strata to depths of around 20.00mbgl.

6.25 It should be appreciated that the groundwater monitoring described above was undertaken during a very short period of time. Significant variations in the long-term groundwater regime may occur at other times, particularly with prolonged, extreme weather conditions, and that no account can be taken of such in this report.

General

6.26 It should also be appreciated that ground conditions may vary between and away from the exploratory hole positions, and that no account can be taken in this report of such variations.

7.0 GEOTECHNICAL APPRAISAL

Site Preparation

7.1 It is understood that an appropriate asbestos survey was carried and all asbestos was removed by a specialist contractor prior to demolition commencing.

7.2 It would also appear that site-wide excavation to remove obstructions was underway during April 2023 subsequent groundworks. The stability of existing adjacent infrastructure will however need to be considered where excavations extend up to the site boundary and it may be necessary to retain existing foundations and/or basements as temporary support under such circumstances.

7.3 Demolition materials, including all asphalt/concrete hardstanding and below ground foundations removed as part of the clearance work, subject to appropriate sorting and crushing, would be suitable for re-use as bulk fill beneath hard cover areas.

7.4 Due to the potential for shallow cohesive soils to become softened if exposed to excess moisture, excavations should be undertaken in a controlled manner so as not to overly expose the soil during periods of inclement weather. Also, the site should, where possible be laid to fall and ideally incorporate a surface protective cover and a degree of temporary drainage to prevent surface ponding and thus enable a trafficable site for construction plant.

7.5 Although not considered to be significant any topsoil removed during site preparatory works and considered for re-use should be stockpiled separately from other materials and protected from inclement weather for future use in landscaped and garden areas subject to confirmatory laboratory testing.

Earthworks

7.6 All earthworks should be carried out in accordance with recommendations and guidance provided in BS6031:2009, Code of Practice for Earthworks. The platform construction works are being undertaken in accordance with the Manual of Contract Documents for Highway Works (MCHW) Volume 1, Series 600, Specification for Highway Works (SHW).

7.7 In summary, the works are to comprise the formation of a development plateau using either 6F2 or 6F5 where required to achieve a California Bearing Ratio (CBR) of 5% (when measured in accordance with BS 1377: Soils for civil engineering purposes: Part 4) at a formation level of 450mm below the proposed finished levels of external hardstanding which are anticipated to be 109.00m AOD. The proposed building FFL is 109.10m AOD.

7.8 Following demolition of any basement walls, slabs and foundations, the voids and basements were to infilled with 6F2 material, brought up to level of adjacent existing ground.

7.9 Fill beyond 3.0m of the building footprint will also be constructed by adopting method compaction in accordance with Table 6/4 of SHW Series 0600.

Coal Seams and Shallow Abandoned Mine Workings

7.10 Some of the rotary boreholes drilled during the Soil Mechanics and IFA investigations have record voided and or loose ground such as would indicate the presence of shallow abandoned mine workings possibly in the Soft Bed Coal seam at depths of between 16.70m and 18.30mbgl.

7.11 For situations where abandoned workings occur at relatively shallow depths, standard industry practice normally takes the maximum predicted height of collapse of such workings as being around 10 times the proven or anticipated seam thickness. In other words, where the solid rock cover is greater than 10 times the seam thickness, the risk of surface instability resulting from collapse of workings is reduced as the upward migration of the void is stalled by bulking of the collapsed strata.

7.12 Records indicate the Soft Bed Coal seam to be in the region of 0.80m thick regionally and this has been proven to some extent in one of the boreholes BH107.

7.13 On this basis, a solid rock cover of around 8.00m would be considered sufficient to maintain surface stability from upward migration of voids and current borehole information indicated that this condition is met. However, it may be prudent to assume that excavations for the extraction of coal could have extended beyond the vertical extent of the seam, particularly in view of the possibility that fireclay associated with the seam may also have also been extracted concurrently.

7.14 In view of this, the thickness of the disturbed ground as recorded in the boreholes is taken as a conservative indication of the worked seam thickness in the following table whilst also noting the location in the proposed development:

Hole	Geometry of Workings		Thickness of Workings (m)	10 Times Thickness (m)	Recorded Thickness of rock cover (m)	Proposed Development Location
	Depth to Top (mbgl)	Depth to Base (mbgl)				
Soil Mechanic 2006						
BH3	16.70	18.80	2.10	21.00	**13.90**	Soft landscaping
BH5	18.30	18.60	0.30	3.00	13.50	Soft landscaping
WML 2017						
BH106	18.70	19.10	0.40	4.00	13.90	Soft landscaping
BH107	18.90	19.70	0.80	8.00	15.10	Asphalt car Park
BH108	18.30	18.90	0.60	6.00	14.40	Soft landscaping

7.15 However, the rotary holes beneath the proposed building formed to a depth of 40.0mbgl encountered intact coal seams at depths of 16.20m and 4.60mbgl in R01 and R02 respectively, and were between 0.10m and 0.30m in thickness. No voids, broken ground or loss of flush such as would indicate the presence of workings beneath the new structure were encountered.

7.16 Therefore, the risk of surface instability resulting from ground movement associated with collapse of abandoned shallow mine workings is considered to be low beneath the currently proposed building location with no specific remedial measures required.

7.17 If additional structures were to be constructed in other areas of the site, this assessment would need to be updated accordingly.

Possible Mine Shafts

7.18 The Coal Authority reports procured as part of the Phase 1 Desk Study, did not identify the presence of any identified mine shafts within the site. However, based on site history it was indicated that unrecorded mine shafts could be encountered on the site.

7.19 Subsequently, during the demolition of the former structures and removal of the slabs a possible brick lined mine shaft was encountered close to the south-eastern site boundary. The standing water level was approximately 14.50mbgl, but the depth of the feature could not be accurately determined.

7.20 Subsequently the Client has employed a specialist drilling and remediation specialist to investigate and remediate the potential mine shaft under the appropriate Coal Authority Licence. This is being undertaken independently to this report.

7.21 On completion of any drilling and grouting the shaft will need to be capped and suitably marked on the surface with a permanent marker such as a fixed plate so that the shaft position may be readily located and identified in the future.

7.22 Current guidance indicates that new structures should be located in order to maintain a safety zone around the shaft. The new structure is not located over the position of the shaft.

Slopes and Retaining Walls

7.23 After completion of the cut and fill exercise, it is anticipated that changes in elevation across the site will be accommodated in the main by retaining walls with localised landscaped slopes.

7.24 Any slopes created as the result of the cut and fill activities will need to ensure their stability in both short and long-term situations, taking account of local ground and groundwater conditions. In this respect, slopes with angles of up to about 1 vertical in 3 horizontal (i.e. about 18 degrees) will be stable in both short and long term conditions.

7.25 Should steeper slopes be necessary, more detailed slope stability analysis is recommended to determine the stability in the long and short term.

7.26 New retaining walls are anticipated to be supported by spread foundations on natural soils where a net allowable bearing pressure of 150kN/m^2 is considered appropriate. This may need to be reduced to 100kN/m^2 where Cohesive Drift is encountered at formation level.

Foundations

7.27 Made Ground at the site is considered unsuitable for the direct support of structural loads as it is generally incompetent, loose and variable in nature, resulting in the potential for unacceptable total and differential settlements.

7.28 In consideration of the proposed earthworks it is considered that the use of traditional foundations would be impractical and uneconomical.

7.29 Therefore, it is anticipated that the made ground would be amenable to treatment by vibro-compaction to achieve a relatively consistent state of compaction throughout. Under such circumstances, a minimum net allowable bearing pressure of 150kN/m^2 is anticipated. Although this should be confirmed by consultation with a reputable specialist contractor.

7.30 Although not anticipated where foundations and floor slabs are to be constructed close to existing and/or removed trees, identification of the tree species will be required to determine its water demand as provided in Appendix 4.2-A of NHBC Standards 2010, Foundations, Chapter 4.2, Building Near Trees. Assessment of the soil heave or shrinkage potential will then need to be undertaken in consideration of a medium volume change potential for the clay with foundations designed to appropriate depths where such effects are envisaged.

Floor Slabs

7.31 The floor slab can be ground bearing where fully supported on engineered granular fill which has been compacted to an appropriate specification. Floor slabs would need to be suitably reinforced.

Excavations and Groundwater

7.32 Excavations beneath the majority of the site should be feasible using an appropriate scale of hydraulic plant but may very locally extend into mudstone, requiring the use of hydraulic breakers and ripping techniques.

7.33 No significant groundwater inflow is anticipated into excavations although shallow perched groundwater conditions may occur locally. Conventional 'sump and pump' dewatering measures are however considered adequate to keep excavations dry.

Pavement Design

7.34 Earthworks are to comprise the formation of a development plateau using either 6F2 or 6F5 where required to achieve a California Bearing Ratio (CBR) of 5% (when measured in accordance with BS 1377: Soils for civil engineering purposes: Part 4 at a formation level of 450mm below the proposed finished levels of external hardstanding.

7.35 The design value will need to be confirmed by suitable in-situ testing at formation levels following any earthwork operations and prior to pavement construction.

Concrete Design

7.36 Design/mix of buried concrete should be undertaken in accordance with the "Aggressive Chemical Environment for Concrete" (ACEC) classification, of BRE Special Digest 1:2005 (Concrete in Aggressive Ground). In consideration of the current development plan which includes the historically developed areas of the site, it is deemed necessary to classify the site as "Brownfield", with respect to BRE Special Digest.

7.37 Concentrations of 2:1 water/soil extract for sulphate do not exceed 0.06mg/l with values of pH ranging from 7.2 to 11.1 indicating near neutral to alkaline conditions. On the basis of these results, the typical design sulphate (DS) class and "Aggressive Chemical Environment for Concrete" (ACEC) class for the site would be DS-1 and AC-1 respectively.

7.38 However, in view of the potential for sulphate to be present in the PLCM strata, it may be prudent to increase the design class to DS-2 and the ACEC class to AC-2z.

Drainage and Soakaways

7.39 In consideration of the cohesive nature of the natural soils beneath the site, soakaways are not considered a feasible drainage option for the site. However, this may need to be confirmed by appropriate soakaway testing at drainage design stage.

Colliery Spoil

7.40 Although not encountered within any of the exploratory holes, the localised presence of colliery spoil cannot be wholly discounted at the site.

7.41 Such material can be problematic due to its potential to expand / heave on exposure to air and / or inundation with water and its inherently high sulphate content and low pH values, which can be aggressive to buried concrete.

7.42 Also, such material may have the potential to be combustible, particularly if it contains high percentages of coal or is high in carbon content.

7.43 Therefore, if encountered during consideration should be given to removing any such material where it will potentially interact with new building foundations and floor slabs.

8.0 GENERIC QUANTITATIVE RISK ASSESSMENT (GQRA)

General

8.1 A review of the desk study and historical investigations has concluded that the potential for a significant pollution linkage to be present is low with more localised risks associated with the former timber yard and works in the southern section of the site.

8.2 This has been confirmed to a large degree by the physical ground investigation with no significant visual and/or olfactory evidence of significant ground contamination being encountered.

8.3 However, in view of the presence of Made Ground beneath the site, it has been considered prudent to adopt a precautionary principal and undertake chemical analysis of selected samples of sub-surface soils to provide further information on the conceptual model and hence confirm the low human health risk status of the site.

Human Health

8.4 Selected samples have been analysed for a general suite of contaminants of concern and compared against Screening Levels (SL's) for human health to determine the significance of the measured concentrations in relation to the site conceptual model. Thus, a Generic Quantitative Risk Assessment has been undertaken in line with guidelines provided in Land Contamination Risk Management, April 2021.

8.5 The criteria for a limited number of contaminants have been derived by DEFRA in their document entitled SP1010: Development of Category 4 Screening Levels for Assessment of Land Affected by Contamination, April 2014.

8.6 Within the document, Category 4 Screening Levels (C4SL's) are described as being more pragmatic than previous screening criteria and represent concentrations in soil that present an 'acceptable' level of risk within the context of Part 2A.

8.7 The National Planning Policy Framework states that 'after development, as a minimum, land should not be capable of being determined as contaminated land under Part 2A of the Environmental Protection Act 1990'. Therefore, by inference, the C4SL's are appropriate for use in the planning context.

8.8 Although the SP1010 document states that C4SL only apply for a 'sandy loam soil with 6% soil organic matter', it is generally accepted that assessment criteria for metals are not sensitive to changes in soil organic content (SOM). The C4SL's have therefore been adopted as assessment criteria in this report for the listed metals within the SP1010.

8.9 Subsequent to SP1010, LQM/CIEH have published a document entitled 'The LQM/CIEH S4ULs for Human Health Risk Assessment' 2015. In brief, the document provides updated assessment criteria which have been derived in accordance with UK legislation, national as well as EA policy and using a modified version of the CLEA software and available guidance. The new screening criteria, or Suitable 4 Use Levels (S4ULs), are intended to provide a complete and updated replacement to the previous LQM/CIEH GAC of 2009. As such they are considered appropriate for use in this assessment for other contaminants not covered by C4SL's and/or for organic contaminants assuming a worst-case Soil Organic Matter (SOM) of 1% as an initial conservative assessment.

8.10 For each contaminant, S4UL's and C4SL's have been calculated for six land use scenarios, namely:

- Residential with homegrown produce.
- Residential without homegrown produce.
- Allotments.
- Commercial.
- Public Open Space, near residential housing.

- Public Parks, remote from residential housing.

8.11 In light of the proposed development, the SL's for a "Commercial" end-use are considered appropriate for the assessment at this stage. A table of relevant SL's are provided in Appendix 08.

Soil Test Results

8.12 A total of 22no samples (5no SM 2006, 1no WML 2017 and 16no 2023) generally of topsoil and Made Ground have been analysed as part of the three stages of investigations for suites of Metals, Semi-Metals and PAH's. The results indicate all of the samples contain concentrations below the screening levels for "Commercial" end use.

8.13 16no samples of shallow soils were also submitted for TPH analyses, with no concentrations exceeding the screening levels.

8.14 No asbestos was recorded within any of the soil samples analysed.

Discussion and Conclusions

Human Health

8.15 In consideration of the chemical test results, it is concluded that the site does not contain any significant and/or widespread contamination sources.

8.16 As the site is currently disused and unoccupied, the risk to human health from direct contact with any unrecorded contamination is considered low.

8.17 Following site development, where surfaced with buildings and hardstanding, there will be no mechanism for a direct contact pollution linkage with any unidentified contaminants. Therefore, the risk to end-users will be negligible in such areas.

8.18 However, in consideration of the potential for made ground to be encountered at formation levels within soft landscaped areas, a direct contact pollution linkage will exist and the soils would be unlikely to be considered as a suitable growing medium for plants and grasses. Therefore, it is anticipated that soft landscaping would need to be capped. This will normally comprise a 300mm clean cover, with a minimum 150mm thickness of topsoil and 150mm thickness of sub-soil, over the existing made ground.

Controlled Waters

8.19 In terms of sensitivity, the groundwater within the superficial 'Secondary (A) Aquifer' is considered to be of limited resource value and utilisation.

8.20 There are no Environment Agency Source Protection Zones (SPZ) within 500m of the site.

8.21 There are no rivers of water courses within proximity of the site.

8.22 Subsequently, due to the lack of visual and/or olfactory evidence of significant contamination, as confirmed to a large degree by the results of chemical analyses, the site is not considered to have been unduly impacted by its historical use.

8.23 Therefore, the risk to controlled waters from the site is considered low with no environmental remediation considered necessary.

9.0 GROUND GAS RISK ASSESSMENT

Methodology

9.1 Current guidance for the assessment of risk associated with the presence of hazardous ground gases (principally methane and carbon dioxide) is provided in two key documents, namely:

- Code of practice for the Characterisation and remediation from Ground Gas in Affected Developments. British Standard Institution (BS 8485:2015); and
- Assessing Risks posed by Hazardous Ground Gases to Buildings CIRIA (C665, 2007).

9.2 The assessment presented herein is primarily based on the BS8485 document.

9.3 Hazardous ground gas qualitative risk assessment is based on a conceptual model similar to that used for soil and groundwater contamination sources (i.e., source-pathway-receptor pollutant linkages). A semi-quantitative estimate of risk can be assessed based on knowledge of the conceptual model and a measure of hazardous gas concentration and gas flow at the site within monitoring standpipes.

9.4 Based on the measured flow rates and hazardous gas concentrations, individual "hazardous gas flow rates" (Qhg) can be derived for each monitoring point, from which the "site characteristic hazardous gas flow rate" (Qhgs), and then the "Characteristic Situation" (CS) can be determined.

9.5 BS8485 provides guidance on the level of gas protection requirements based upon the characteristic situation and the proposed development based on building type as outlined in Table 3.

Table 3 - Building Types

	Type A	Type B	Type C	Type D
Ownership	Private	Private or commercial/ Public, possible multiple	Commercial / Public	Commercial / Industrial
Control (Change of use)	None	Some but not all	Full	Full
Room Sizes	Small	Small/ medium	Small to Large	Large Industrial/ Retail Park

9.6 The proposed development therefore is indicated to comprise the construction of Type C which comprise commercial buildings with central building control to undertake building maintenance.

Ground Gas Conceptual Model

9.7 The property is not within an area where radon protection is required.

9.8 There are no active, non-operational or historic landfills within 500m of the site.

9.9 The underlying geology includes abandoned workings within relatively shallow coal seams which could have the potential to release hazardous ground gas through possible lines of weakness in the solid strata such as geological faults or mine entries. However, these are located outside the proposed building footprint.

9.10 No appreciable thickness of made ground with a high organic content or other soil with significant organic content have been encountered beneath the site.

9.11 During previous investigations (Soil Mechanics 2002), ground gas monitoring recorded slightly elevated concentrations of methane, ranging from below detectable limits to 0.40% by volume in air (v/v) and slightly elevated concentrations of carbon dioxide, ranging from below detectable limits to 3.8%v/v. No significant flow rates were recorded.

9.12 In consideration of the preliminary conceptual model, the preliminary risk to the development from ground gas has been assessed as medium. It was therefore considered prudent to undertake ground gas monitoring, primarily for methane and carbon dioxide, with associated flow rates, on a further 4no occasions between 13th January and 15th February 2017.

Monitoring Results and Recommendations

9.13 The results of the combined 10 no gas monitoring visits within the site area indicate concentrations of methane ranging from below detection limits to a maximum of 0.4% by volume in air (v/v in 2006) and a maximum steady state carbon dioxide concentration of 3.8% (v/v).

9.14 No positive ground gas flows were recorded during the monitoring visits.

9.15 The results give a maximum composite Qhg value of <0.004l/hr and indicate the site to classify as Characteristic Situation (CS) 1 – 'Very Low Gas Risk' in accordance with BS8485:2015, with no specific gas protection measures required.

10.0 OTHER POTENTIAL DEVELOPMENT CONSIDERATIONS

Waste Soils Characterisation

10.1 Excavation works undertaken during the development are likely to produce waste soils for which appropriate waste management will be required. In line with current sustainability principals, any waste soils should firstly be considered for re-use where possible by incorporation into the development.

10.2 The re-use of excavated topsoil in such areas should only be considered following further confirmatory chemical analysis.

10.3 It should be noted that the chemical analysis results for disposal classification are assessed against different assessment criteria to those relating to contamination risk assessment. Soils that are deemed suitable for use in terms of risk to human health and the environment may not necessary be un-contaminated and could be classified as Non-Hazardous or even Hazardous for disposal purposes.

10.4 For preliminary guidance based on the current information, it is likely that made ground, would be classified as 'Non-hazardous' with natural soils classified as 'Inert' for landfill disposal.

10.5 However, excavated soils which are contaminated with TPH compounds may classify as 'Hazardous' if disposed to landfill. Any soils containing ACM or significant asbestos fibres may also classify as 'Hazardous' following further quantification analysis.

10.6 In addition, for Inert and Hazardous waste disposal, allowance will need to be made for adequate Waste Acceptance Criteria (WAC) testing with appropriate consideration of the additional time and cost associated with this.

10.7 It will be the responsibility of the waste producer to undertake further testing and classification of any waste soils for disposal to an appropriately licenced landfill in accordance with current guidelines and Duty of Care requirements.

Imported Fill

10.8 All imported fill, such as topsoil, will be subject to specific quality requirements. Allowance should be made for testing imported fill materials prior to emplacement to ensure suitability.

Water Supply Pipes

10.9 The utilities company will need to be consulted with regards to the selection of suitable water supply pipe materials for the development. However, in light of the ground conditions encountered, the requirement for specific materials and measures to protect the water supply from ground contamination is not envisaged.

PROTECTION OF EXISTING VEGETATION

Trees to be protected where necessary during works by a tree protective barrier, secured to a scaffold tubing framework with fluorescent tape to the top rail. Protective fencing shall be erected on the canopy drip line wherever possible. Laminated, waterproof A4 signs shall be fixed to the fence posts at 10m intervals bearing the words 'PROTECTED TREE ZONE - NO STORAGE OR OPERATIONS WITHIN FENCED AREA'.
Tracking of machinery, storage of chemicals and building materials shall not be permitted within the protected area. Leaks or spills should be removed immediately and the contaminated soil replaced. No bonfires shall be lit within 5m of the canopy spread. Any excavation work beneath the canopy spread shall be carried out by hand.
All works affecting trees within the development shall be subject to BS 5837:2012.

General notes: Tests carried out in accordance with BS1377: Part 7: 1990, clause 8 for single stage, clause 9 for multistage tests. Specimens nominally 2:1 height diameter ratio and tested at a rate of strain of 2%/minute, unless annotated otherwise. See individual test reports for further details.

Legend
- UU - single stage test (may be in sets of specimens)
- UUM - multistage test on a single specimen
- suffix R - remoulded or recompacted
- δ_3 cell pressure
- $\delta_1 - \delta_3$ deviator stress
- C_u undrained shear strength
- Mode of failure: P plastic; B brittle; C compound

"M" denotes that % fit has been manually interpreted

Internal Standards	% Area
1,4-Dichlorobenzene-d4	NA
Naphthalene-d8	106
Acenaphthene-d10	106
Phenanthrene-d10	119
Chrysene-d12	122
Perylene-d12	122

Surrogates	% Rec
Nitrobenzene-d5	N.D
2-Fluorobiphenyl	121
Terphenyl-d14	81

Concentrations are reported on a wet weight basis.

The Total PAH result is the sum of non-rounded individual PAH results and therefore may differ to the sum of the rounded individual PAH results printed above. By convention, where any one or more result is a "less than", the total is expressed as a "less than" and includes the "less than" concentration within the total.

SAMPLE INFORMATION

MCERTS (Soils):

Soil descriptions are only intended to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions. MCERTS accreditation applies for sand, clay and loam/topsoil, or combinations of these whether these are derived from naturally occurring soils or from made ground, as long as these materials constitute the major part of the sample. Other materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

DEVIATING SAMPLE INFORMATION

Comments
Sample deviation is determined in accordance with the UKAS note "Guidance on Deviating Samples" and based on reference standards and laboratory trials.
For samples identified as deviating, test result(s) may be compromised and may not be representative of the sample at the time of sampling.
Chemtech Environmental Ltd cannot be held responsible for the integrity of sample(s) received if Chemtech Environmental Ltd did not undertake the sampling. Such samples may be deviating.

Key

N	No (not deviating sample)
Y	Yes (deviating sample)
NSD	Sampling date not provided
NST	Sampling time not provided (waters only)
EHT	Sample exceeded holding time(s)
IC	Sample not received in appropriate containers
HP	Headspace present in sample container
NCF	Sample not chemically fixed (where appropriate)
OR	Other (specify)

Lab ref	Sample id	Depth (m)	Deviating	Tests (Reason for deviation)

ADDITIONAL INFORMATION

Notes

Opinions and interpretations expressed herein are outside the UKAS accreditation scope.

Unless otherwise stated, Chemtech Environmental Ltd was not responsible for sampling.

All testing carried out at Unit 6 Parkhead, Stanley, DH9 7YB, except for subcontracted testing.

Methods, procedures and performance data are available on request.

Results reported herein relate only to the material supplied to the laboratory.

This report shall not be reproduced except in full, without prior written approval.

Samples will be disposed of 4 weeks from initial receipt unless otherwise instructed.

BTEX compounds are identified by retention time only and may include interference from co-eluting compounds.

For soils and solids, all results are reported on a dry basis. Samples dried at no more than 30°C in a drying cabinet.

For soils and solids, analytical results are inclusive of stones, where applicable.

Moisture Content Calculated on a Wet Weight basis

Chemtech Environmental Limited

TEST REPORT REVISIONS

The table below identifies ammendments that have been made to this test report for each revision.

SAMPLE INFORMATION

MCERTS (Soils):

Soil descriptions are only intended to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions. MCERTS accreditation applies for sand, clay and loam/topsoil, or combinations of these whether these are derived from naturally occurring soils or from made ground, as long as these materials constitute the major part of the sample. Other materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

Lab ref	Sample id	Depth (m)	Sample description	Material removed	% Removed	% Moisture
121982-1	TP9 Topsoil	-	Loamy Clay with Roots	-	-	29.8
121982-2	TP11 Made Ground	-	Sand with Gravel & Roots	-	-	9.8
121982-3	TP11 Natural Ground	-	Sand with Gravel	-	-	8.7

METHOD DETAILS

METHOD	SOILS	METHOD SUMMARY	SAMPLE	STATUS	LOD	UNITS
CE250	EPH Aromatic (>EC10-EC12)	Solvent extraction, GCxGC-FID	As received		1	mg/kg
CE250	EPH Aromatic (>EC12-EC16)	Solvent extraction, GCxGC-FID	As received		1	mg/kg
CE250	EPH Aromatic (>EC16-EC21)	Solvent extraction, GCxGC-FID	As received		1	mg/kg
CE250	EPH Aromatic (>EC21-EC35)	Solvent extraction, GCxGC-FID	As received		1	mg/kg
CE250	EPH Aromatic (>EC35-EC44)	Solvent extraction, GCxGC-FID	As received		1	mg/kg
CE067	VPH Aliphatic (>C5-C6)	Headspace GC-FID	As received		0.1	mg/kg
CE067	VPH Aliphatic (>C6-C8)	Headspace GC-FID	As received		0.1	mg/kg
CE067	VPH Aliphatic (>C8-C10)	Headspace GC-FID	As received		0.1	mg/kg
CE250	EPH Aliphatic (>C10-C12)	Solvent extraction, GCxGC-FID	As received		6	mg/kg
CE250	EPH Aliphatic (>C12-C16)	Solvent extraction, GCxGC-FID	As received		6	mg/kg
CE250	EPH Aliphatic (>C16-C35)	Solvent extraction, GCxGC-FID	As received		15	mg/kg
CE250	EPH Aliphatic (>C35-C44)	Solvent extraction, GCxGC-FID	As received		10	mg/kg

Chemtech Environmental Limited

DEVIATING SAMPLE INFORMATION

Comments
Sample deviation is determined in accordance with the UKAS note "Guidance on Deviating Samples" and based on reference standards and laboratory trials.
For samples identified as deviating, test result(s) may be compromised and may not be representative of the sample at the time of sampling.
Chemtech Environmental Ltd cannot be held responsible for the integrity of sample(s) received if Chemtech Environmental Ltd did not undertake the sampling. Such samples may be deviating.

Key

N	No (not deviating sample)
Y	Yes (deviating sample)
NSD	Sampling date not provided
NST	Sampling time not provided (waters only)
EHT	Sample exceeded holding time(s)
IC	Sample not received in appropriate containers
HP	Headspace present in sample container
NCF	Sample not chemically fixed (where appropriate)
OR	Other (specify)

Lab ref	Sample id	Depth (m)	Deviating	Tests (Reason for deviation)
121982-1	TP9 Topsoil	-	N	
121982-2	TP11 Made Ground	-	N	
121982-3	TP11 Natural Ground	-	N	

Chemtech Environmental Limited

ADDITIONAL INFORMATION

Notes

Opinions and interpretations expressed herein are outside the UKAS accreditation scope.

Unless otherwise stated, Chemtech Environmental Ltd was not responsible for sampling.

All testing carried out at Unit 6 Parkhead, Stanley, DH9 7YB, except for subcontracted testing.

Methods, procedures and performance data are available on request.

Results reported herein relate only to the material supplied to the laboratory.

This report shall not be reproduced except in full, without prior written approval.

Samples will be disposed of 4 weeks from initial receipt unless otherwise instructed.

BTEX compounds are identified by retention time only and may include interference from co-eluting compounds.

For soils and solids, all results are reported on a dry basis. Samples dried at no more than 30°C in a drying cabinet.

For soils and solids, analytical results are inclusive of stones, where applicable.

Moisture Content Calculated on a Wet Weight basis

Index to symbols used in 626869-1

Value	Description
M105	Analysis conducted on an "as received" aliquot. Results are reported on a dry weight basis where moisture content was determined by assisted drying of sample at 105C
A40	Assisted dried < 40C
M40	Analysis conducted on sample assisted dried at no more than 40C. Results are reported on a dry weight basis.
AR	As Received
N.D.	Not Detected
9	LOD raised due to dilution of sample
13	Results have been blank corrected.
S	Analysis was subcontracted
M	Analysis is MCERTS accredited
U	Analysis is UKAS accredited
N	Analysis is not UKAS accredited

Notes

Asbestos was subcontracted to REC Asbestos.

T207	GC/MS (MCERTS)

Accreditation Summary

Determinand	Method	Test Sample	LOD	Units	Symbol	SAL References
Boron (water-soluble)	T6	AR	1	mg/kg	N	001-007
Chromium VI	T6	AR	1	mg/kg	N	001-007
Vanadium	T6	A40	1	mg/kg	U	001-007
Cyanide(Total)	T546	AR	1	mg/kg	M	001-007
Phenol	T207	M105	0.1	mg/kg	M	001-007
(Water Soluble) SO4 expressed as SO4	T242	AR	0.01	g/l	N	001-007
Sulphur (total)	T21	AR	0.05	%	N	001-007
Total Organic Carbon	T21	M40	0.1	%	N	001-007
Asbestos ID	T27	AR			SU	001-007
pH	T7	AR			M	001-007
Arsenic	T6	M40	2	mg/kg	M	001-007
Cadmium	T6	M40	1	mg/kg	M	001-007
Chromium	T6	M40	1	mg/kg	M	001-007
Copper	T6	M40	1	mg/kg	M	001-007
Lead	T6	M40	1	mg/kg	M	001-007
Mercury	T6	M40	1	mg/kg	M	001-007
Nickel	T6	M40	1	mg/kg	M	001-007
Selenium	T6	M40	3	mg/kg	M	001-007
Zinc	T6	M40	1	mg/kg	M	001-007
Moisture @105C	T162	AR	0.1	%	N	001-007
Retained on 10mm sieve	T2	M40	0.1	%	N	001-007
Naphthalene	T207	M105	0.1	mg/kg	M	001-007
Acenaphthylene	T207	M105	0.1	mg/kg	U	001-007
Acenaphthene	T207	M105	0.1	mg/kg	M	001-007
Fluorene	T207	M105	0.1	mg/kg	M	001-007
Phenanthrene	T207	M105	0.1	mg/kg	M	001-007
Anthracene	T207	M105	0.1	mg/kg	U	001-007

Determinand	Method	Test Sample	LOD	Units	Symbol	SAL References
Fluoranthene	T207	M105	0.1	mg/kg	M	001-007
Pyrene	T207	M105	0.1	mg/kg	M	001-007
Benzo(a)Anthracene	T207	M105	0.1	mg/kg	M	001-007
Chrysene	T207	M105	0.1	mg/kg	M	001-007
Benzo(b)fluoranthene	T207	M105	0.1	mg/kg	M	001-007
Benzo(k)fluoranthene	T207	M105	0.1	mg/kg	M	001-007
Benzo(a)Pyrene	T207	M105	0.1	mg/kg	M	001-007
Indeno(123-cd)Pyrene	T207	M105	0.1	mg/kg	M	001-007

TPH (C35-C44 aromatic)	T8	M105	1	mg/kg	N	002-003

APPENDIX 07

Ground Gas Monitoring 2017

IAN FARMER ASSOCIATES
Geotechnical & Environmental Specialists

Gas and Groundwater Monitoring Results

Contract Number:	*42009*	**Gas Monitor:**	*GA5000*
Contract Name:	*Trinity Street*	**Readings Taken By:**	*JM*
Date:	*13th January 2017*	**Checked By:**	*MHW*

Background Readings:			O_2% v/v	CO_2% v/v	CH_4% v/v	CO ppm	H_2S ppm
	Weather Conditions:	*Dry, approx. 2 °C*					
	Ground Conditions (dry / wet etc):	*Frozen, snow*					
	Atmospheric Pressure (Start):	*999mb*	*20.9*	*0.1*	*0.0*	*0.0*	*0.0*
	Atmospheric Pressure (Finish):	*1000mb*					
	Time (Start): 10:00 Time (Finish):	11:05					

Hole No:	VOC ppm	O_2% v/v	CO_2% v/v	CH_4% v/v		CO ppm	H_2S ppm	Rel Pressure (mb)	Gas flow Rate (l/hr)	Depth to base of well	SWL	LNAPL or DNAPL
	Steady	Steady	Steady	Peak	Steady	Steady	Steady	Steady	Range	mBGL	mBGL	mBGL
WS101	*NR*	*20.7*	*0.3*	*0.0*	*0.0*	*0*	*0*	*0.42*	*0.0*	*1.42*	*DRY*	*NA*
WS102	*NR*	*20.9*	*0.1*	*0.0*	*0.0*	*0*	*0*	*0.42*	*0.0*	*3.06*	*2.99*	*NR*
WS103	*NR*	*19.4*	*0.6*	*0.0*	*0.0*	*0*	*0*	*0.42*	*0.0*	*2.13*	*2.11*	*NR*
WS104	*NR*	*17.0*	*2.3*	*0.0*	*0.0*	*0*	*0*	*0.42*	*0.0*	*1.73*	*DRY*	*NA*
WS106	*NR*	*19.4*	*1.6*	*0.0*	*0.0*	*0*	*0*	*0.42*	*0.0*	*3.14*	*DRY*	*NA*

>>>> = Flow above detection limit of 30 l/hr, <<< = Negative flow greater than -10 l/hr. >Max = In excess of lower explosive limit.

Remarks: WS102 - unable to monitor as borehole covered by a car.

APPENDIX 08

Site Specific Assessment Criteria

Screening Levels for "Commercial" end use assuming a 1% SOM for Hydrocarbons.

Contaminant	Screening Levels for Commercial End Use (mg/kg)
Metals	
Arsenic	640
Boron	240,000
Cadmium	190
Chromium III	8,600
Chromium VI	33
Copper	68,000
Lead*	2300
Mercury	58
Nickel	980
Selenium	12,000
Vanadium	9,000
Zinc	730,000
Non Metals	
Phenol	440
Polyaromatic Hydrocarbons (PAHs)	
Benz[a]anthracene	170
Benzo[a]pyrene	35
Benzo[b]fluoranthene	44
Benzo[ghi]perylene	3,900
Benzo[k]fluoranthene	1,200
Chrysene	350
Dibenz[ah]anthracene	3.5
Fluoranthene	23,000
Indeno[123-cd]pyrene	500
Naphthalene	190
Pyrene	54,000

* Where not included in the S4UL's criteria for a limited number of contaminants, namely lead, have been derived by DEFRA in their document entitled SP1010: Development of Category 4 Screening Levels for Assessment of Land Affected by Contamination, April 2014.

Contaminant	Screening Levels for Commercial End Use (mg/kg)
Volatile Organic Compounds	
Benzene	27
Ethylbenzene	5,700
Toluene	56,000
M - Xylene	6,200
O - Xylene	6,600
P - Xylene	5,900
Total Petroleum Hydrocarbons	
Aliphatic C5-6	3,200
Aliphatic C6-8	7,800
Aliphatic C8-10	2,000
Aliphatic C10-12	9,700
Aliphatic C12-16	59,000
Aliphatic C16-35	1,600,000
Aliphatic C35 - 44	1,600,000
Aromatic C5 - 7	26,000
Aromatic C7 - 8	56,000
Aromatic C8-10	3,500
Aromatic C10-12	16,000
Aromatic C12-16	36,000
Aromatic C16-21	28,000
Aromatic C21-35	28,000
Aromatic C35 - 44	28,000

* Where not included in the S4UL's criteria for a limited number of contaminants, namely lead, have been derived by DEFRA in their document entitled SP1010: Development of Category 4 Screening Levels for Assessment of Land Affected by Contamination, April 2014.
