SUMMARY TABLE: Phase 1 Desk Study	
SITE:	Parkwood Mills 6 & 7, Grove Street, Huddersfield
CLIENT:	AH Development Ltd
DATE:	June 2025
REFERENCE	PS3695 – V1
DEVELOPMENT PROPOSAL:	<p>Parkwood Mills Units 6 & 7 are part of a broad programme for the regeneration of the Longwood area of west Huddersfield. The regeneration includes the modern reuse of the former Parkwood Mills, for domestic residence and other uses.</p> <p>Most of the Parkwood Mills are Grade II listed structures so much of the external construction will be retained. It has been recognised that the buildings are of national importance.</p> <p>This study looks at the wider area of the site as defined by the red line boundary.</p>

1.0 INTRODUCTION

1.1 PREAMBLE

Phil Shelton Geotechnical Consultancy Limited (PS Geotech) has been instructed by MacMarshalls Ltd - Rural Planning Consultant, on behalf of AH Development Ltd (Client) to provide support to a planning application for the change of use of the former structure known as Parkwood Mills Units 6 and 7 to domestic residential apartments.

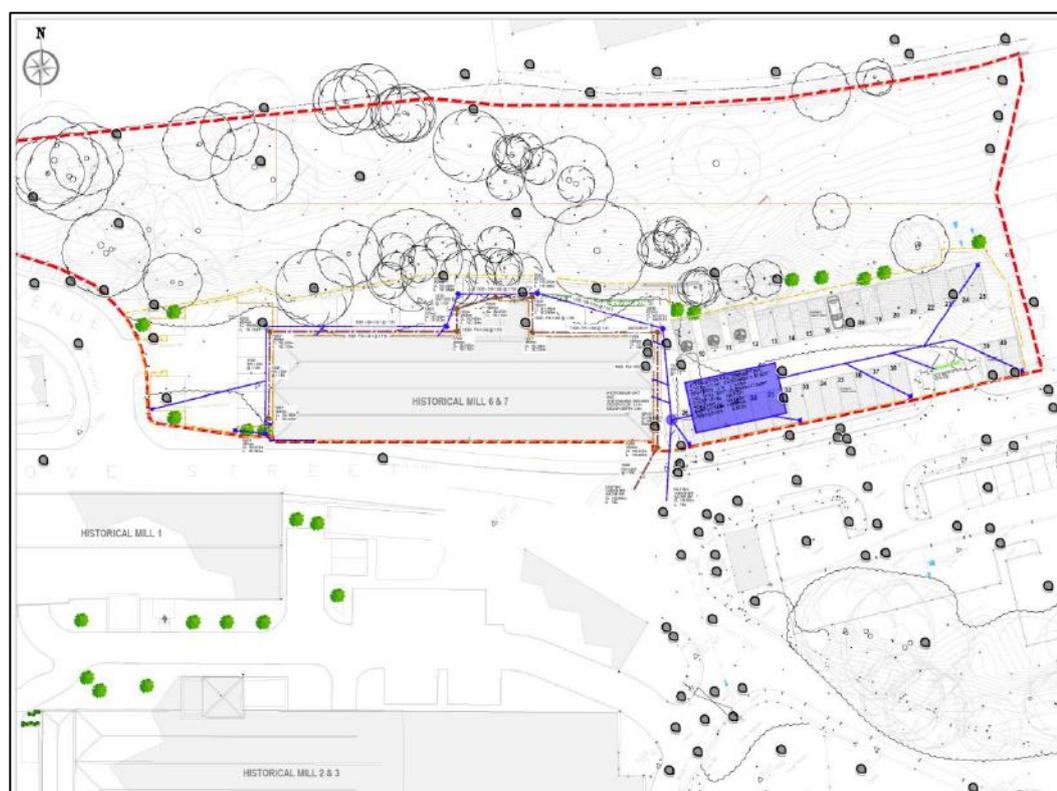

The assistance in this case takes the form of a Phase 1 geoenvironmental desk top study of the site.

The proposed development will be located within the Parkwood Mills area of west Huddersfield, which has a rich history of woollen fabric weaving dating back to the mid-19th century. The mill complex includes several buildings, with the earliest dating back to the early 1850s.

While the mills fell into disuse during the latter half of the 20th century, the structures remained as significant edifices so that in recent years the Parkwood Mills area has benefitted from a local push to preserve and re-purpose the former industrial buildings so that the area is now termed as 'residential and light commercial'.

The area that forms this study is known as Mills 6 & 7 and is located on the northern side of Grove Street close to the junction with Stoney Lane as shown in **Figures 1 to 4 in Appendix A**.

The site includes the brick built Grade II listed building along with the surrounding grounds as shown below.

The Phase 1 desk study is aimed at identifying potential sources of contamination and other geoenvironmental constraints as a result of the site's (and immediate surrounding area's) past usage and providing guidance on geotechnical factors affecting the foundation design for new residential buildings.

The study will conclude with the preparation of a conceptual site model (CSM) to demonstrate the potential risks to designated receptors including construction workers, end users and local environment (groundwater, surface run-off, air-borne dust). This will be based on an industry standard using the Source – Pathway – Receptor risk assessment concept.

Plans showing the site location and proposed development are included in **Appendix A**.

The Phase 1 desk top study has been informed by the acquisition of an Envirocheck environmental data report (Reference: 368565458_1_1, dated 30th January 2025), which has been included as **Appendix B**. This report was acquired for an adjacent mill site on behalf of A H Development Ltd and is being re-used here to cover Mill 6 & 7.

1.2 LIMITATIONS

This report has been produced in accordance with industry best practice at the time of writing.

Phil Shelton Geotechnical Consultancy has, in the production of this report, relied upon information provided by third parties. Phil Shelton Geotechnical Consultancy does not warrant the accuracy of this information and will not be responsible for any opinions, which Phil Shelton Geotechnical Consultancy has expressed, or conclusions which it has drawn, in reliance upon information which is subsequently proven to be inaccurate.

All statements and opinions provided in this report have been presented in good faith and are based on the information gained during, and restrictions imposed by, desk study techniques used at the time. Phil Shelton Geotechnical Consultancy cannot be held responsible for conditions not revealed by the study.

This report has been prepared for the sole use of the Client and shall not be relied upon or transferred to third parties without the express written consent of Phil Shelton Geotechnical Consultancy. Unauthorised third parties rely upon the information contained within this report at their own risk.

2.0 PHYSICAL CONTEXT

2.1 SITE DETAILS

Site Name & Address: Land on the northern side of Grove Street and the junction with Stoney Lane, Longwood, Huddersfield, HD3 4ZQ.

National Grid Reference / Site Area: 410465 416865 (representative of the central part of the listed building). The area of the structure is approximately 700m², while the grounds occupy an area almost 0.65ha.

Client: AH Development Ltd.

Planning Consultant: MacMarshalls Rural Chartered Surveyors & Planning Consultants, Hamill House, 112-116 Chorley New Road, Bolton, Lancashire, BL1 4DH.

Description of Location: The proposed development will be located some 2.2km west of Huddersfield town centre, within the Parkwood Mills area of Longwood, which has a history of woollen fabric weaving dating back to the mid-19th century. The site location is shown in **Figure 1** in **Appendix A**.

The general area is that of a relatively shallow valley, probably glacial in origin, but draining quickly towards the east. This made it ideal for the development of watermill powered industries. The headwaters were channelled and controlled by works undertaken by Huddersfield Waterworks, that diverted surface waters from the west and north-west into man-made leats and goits to feed the mills. The valley also contains mill ponds that collected the water after passing through the mills. Historical mapping shows a mill pond approximately 100m east of the junction between Grove Street and Stoney Lane. This has now been filled and used as hardstanding to new commercial facilities.

The original Parkwood Mill 6 & 7 units form a commanding position on the northern side of Grove Street as shown below. Many of these are now listed for preservation, which is giving a boost to the local area regeneration. Some have already been converted into residential apartments, while others remain vacant.

However, the grounds around Mill 6&7 are substantial and occupy a significant proportion of the full site.

Aerial views of the full site are shown in **Figure 2** in **Appendix A**, and a surveyed plan is shown in **Figure 3** also in **Appendix A**.

It is interesting to note that the Google Earth aerial view shows almost complete tree cover in the areas surrounding the Mill building; while the survey only shows an apparently smaller number of trees of concern, mainly at the western end.

Towards the east, down-slope along Grove Street (see below), the ground level falls, but there are few visible remains of the woollen milling industries.

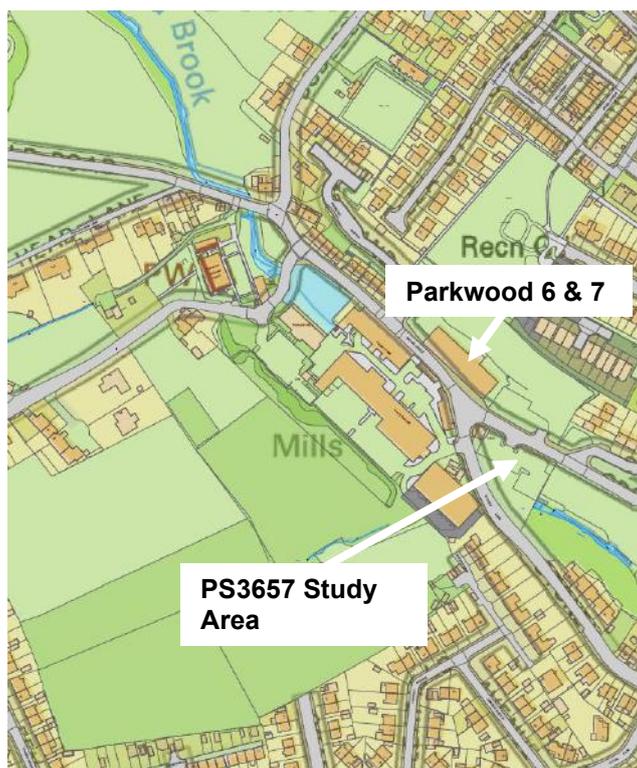

Services: Live electrical, gas and data services along with drainage utilities may be present beneath the red-line boundary of the development site.

A comprehensive services/utilities search was commissioned by Rebecca Bennett, 28 March 2024, Ref: Groundwise Searches Ltd, 349 68RB-GWS for nearby sites. Extracts from this are discussed below and included in **Appendix A**. PS Geotech has had access to this document, but has not included it within this report.

Longwood Brook: Historical mapping shows that the accumulation of head-waters to power the Parkwood Mills were channelled through the Longwood Brook via series of reservoirs at the north-western end of Grove street then through culvert to the various mill units. The brook finally emerging again south-east of Units 6 & 7 along Grove Street close to an area that PS Geotech prepared a Phase 1 Desk Study for AH Developments Ltd in January 2025 (PS3657).

The Figure below shows the expected position of the Longwood Brook in culvert.

.2 SITE HISTORY

Historical records contained within the Envirocheck report (*ibid*), **Appendix B**, along with other publicly available sources have been reviewed to develop a context of land use over the last 150 years.

Table 1: Summary of Geological History		
Date	On-Site	Off-Site
1854	At a scale of 1:10,560 the resolution of the site is poor, but it appears to be vacant but with other wool mills in the immediate area.	The plan shown for 1854 appears to have been produced on behalf of Huddersfield Waterworks and shows the systematic collection and channelling of headwaters into the Parkwood area. Parkwood, at this time is shown as undeveloped woodland. Some small mills are shown to the east of the site. A 'mill pond' seems to be shown to the immediate east of the site on the southern side of Grove Street.
1893 - 1961	At 1:2,500 scale, the plans show that before the end of the 19 th century most of the Parkwood woollen mills were extant. Mill ponds are shown at the upper and lower levels of Grove Road. Little change on site through this period,	The most striking feature is that the full complement of Parkwood Mills to the north-west are now established, which is consistent with historical records. The small area at the junction between Grove Street and Stoney Lane (now occupied by the electrical sub-station) is shown with 2 no. circular features of unknown use. The actual position of the Longwood Brook culvert(s) is not clear.

Table 1: Summary of Geological History		
Date	On-Site	Off-Site
	By the mid-1900s, the textile industry in Huddersfield, including Parkwood Mills, began to see reduced demand.	
1966 - 1983	No significant change.	No significant change, but it is apparent from other sources that the woollen textile industry in Huddersfield was in serious decline.
2025	No significant change	No significant change, but serious consideration of making a change of the former mill structures for residential re-use. This is seen as an attractive option for the re-development of the area.

3.0 ENVIRONMENTAL CONTEXT

3.1 SITE GEOLOGY

The geological and mining assessments for this site have been based on geological maps published by the BGS and Geindex.

The following documents have been reviewed as part of this study;

- BGS 1:50,000 Sheet 77 Huddersfield, Solid & Drift and Solid Editions (2013), Solid Edition, 1977;
- Geology of the Huddersfield district. A brief explanation of the geological map Sheet 77 Huddersfield;
- Geindex Interactive website;
- Mining Remediation Authority (Former Coal Authority) Interactive website.

Made Ground

Variable man-made conditions, notably landfill and areas of industrial past usage are a potential problem with respect to differential settlement and ground gas.

Geological records show indications of both at this site. A review of site history shows that industrial activities associated with the Parkwood Mills complex could have resulted in the accumulation of a variety of Made Ground products. In particular, the Longwood Brook is known to pass by culvert through the site, which could also be a conduit for ground gases.

Superficial Deposits

Extracts from the BGS Sheet 77 Huddersfield (Solid and Drift) and the Geindex Interactive website are included as **Figures 6** and **7** in **Appendix A**. These records show that natural superficial deposits are probably absent from the site. Alluvium can accumulate at the base of river valleys, but this is considered by PS Geotech to be unlikely at this site.

Solid Strata

Geological records show solid strata beneath the site to belong to the Huddersfield White Rock Sandstone, which is part of the Marsden Formation of the Millstone Grit Group and of Carboniferous age. The Huddersfield White Sandstone is a well-known thick sandstone unit commonly found at ground level in the Huddersfield area. It typically consists of pale grey medium to coarse grained, massive to flaggy, cross bedded micaceous sandstone.

A significant fault is shown to be present a few metres to the north of the site trending north-west to south-east along the line of the original Longwood Brook channel. The fault, named as the Longwood Fault, downthrows towards the north-east bringing the Rossendale Sandstone/Mudstone and Rough Rock to near ground surface.

The BGS hold a database of historical borehole records. This includes a borehole record drilled some 50m south-west of the site during 1933, which shows hard sandstone from ground level.

The Longwood Fault is a significant geological feature in the Huddersfield area of West Yorkshire. It is a northwest–southeast trending fault that can be traced from Huddersfield towards Slaithwaite. This fault is part of a broader network of faults in the region, including the Lepton, Kirkburton, Marsden, and Wessenden faults, all of which exhibit a downthrow to the east and terminate against the larger Holme Fault.

In terms of recent seismic activity, the Huddersfield area, including regions near the Longwood Fault, experiences low levels of seismicity. Over the past decade, there have been a few minor earthquakes in the vicinity, with magnitudes ranging from 2.2 to 4.0. The most recent event recorded was a magnitude 2.2 earthquake on December 17, 2024, located approximately 97 km south-southeast of Huddersfield. These events are relatively small and are not uncommon in the UK, which is considered a region of low to moderate seismicity.

Currently, there is no evidence to suggest that the Longwood Fault is experiencing significant movement or poses a heightened seismic risk. The fault remains an important feature for understanding the geological history of the region but does not appear to be a source of active seismic hazard at this time.

3.2 COAL MINING RISK ASSESSMENT

While Parkwood Mills area is located within a general coal mining area, it does not lie within a designated Development High Risk Area. As such it is considered that the risk of ground surface instability as a result of the collapse of abandoned coal mine workings or abandoned coal mine entries is negligible. As a result, no further assessment or intrusive investigation works by the client are required with regards to historical coal mining activities.

3.3 SURFACE MINERAL EXTRACTION / QUARRYING

Based on published OS maps dating from as early as c.1854 until the present day there is no evidence of any mineral extraction within the boundary of the site although undefined excavations are shown to the south-east and northwest, presumably into the various sandstone formations.

The EnviroCheck report – **Appendix B** – records several sand pits towards the north-west of the site, but these are of negligible impact on the proposed development.

3.4 ENVIRONMENTAL ISSUES

As part of the Phase 1 Desk Study process, a bespoke geoenvironmental report for the Parkwood Mills area has been acquired from EnviroSearch Ltd. The full report is included in **Appendix B**.

A summary of the pertinent findings of the report is included below in Table 2 – negative/trivial findings have not been included in the summary table.

Table 2: Summary of EnviroCheck Report			
Page No.	Source of Information	Comment	Significance
1	BGS Groundwater Flooding Susceptibility	<u>On site</u> : Limited Potential for Groundwater Flooding	Very Low
2	Environment Agency Discharge Consents	<u>Onsite</u> : None <u>Offsite</u> : Parkwood Mills – Ceased 1996	Very Low
8	Environment Agency Pollution Incidents	<u>Adjacent Site</u> (<10m) 1997, Detergents and surfactants.	Very Low
10	Environment Agency Water Abstractions	<u>Onsite</u> : None <u>Offsite</u> : None within 100m	Low
29	Historical Landfill Site	<u>On site 1984 - 86</u> : Deposited Waste included Inert and Commercial Waste. <u>Prohibited wastes</u> : Liable to cause environmental hazards: poisonous, noxious, polluting wastes	High
31	BGS Registered Landfill site	<u>Onsite</u> : None <u>Offsite</u> : c. 35m south-east, construction and demolition waste.	Medium
33	BGS Geology	<u>Onsite</u> : Millstone Grit Group	Negligible

Table 2: Summary of EnviroCheck Report			
Page No.	Source of Information	Comment	Significance
33	BGS Soil Chemistry mg/kg	Onsite: Arsenic 25 – 35; Cadmium <1.8; Chromium 60 - 90; Lead 300 – 600; Nickel 15-30.	Medium
40	Contemporary Trade Directory Entries	Onsite: None Offsite: Low risk	Very Low
46	Fuel Stations	Onsite: None Offsite: None within 850m	Negligible
46	Commercial Services	Onsite: None Offsite: Low risk	Very Low

The main geoenvironmental risk included in the EnviroCheck report is the identification of a registered landfill to the south-east of the site, which had already been identified by the historical research. What has become apparent is that the materials used to backfill the former mill pond included Inert and Commercial Waste and excluded materials “liable to cause environmental hazards: poisonous, noxious, polluting wastes”.

3.5 SITE HYDROGEOLOGY

- There are no Source Protection Zones recorded within 1km of the site boundaries;
- the closest Water Abstractions are a little over 100m north of the site, these are in a different groundwater system to the Longwood Brook;
- there are no superficial soils beneath the site and therefore no superficial soil aquifers;
- the underlying solid geology has been designated as a Secondary Aquifer - A.

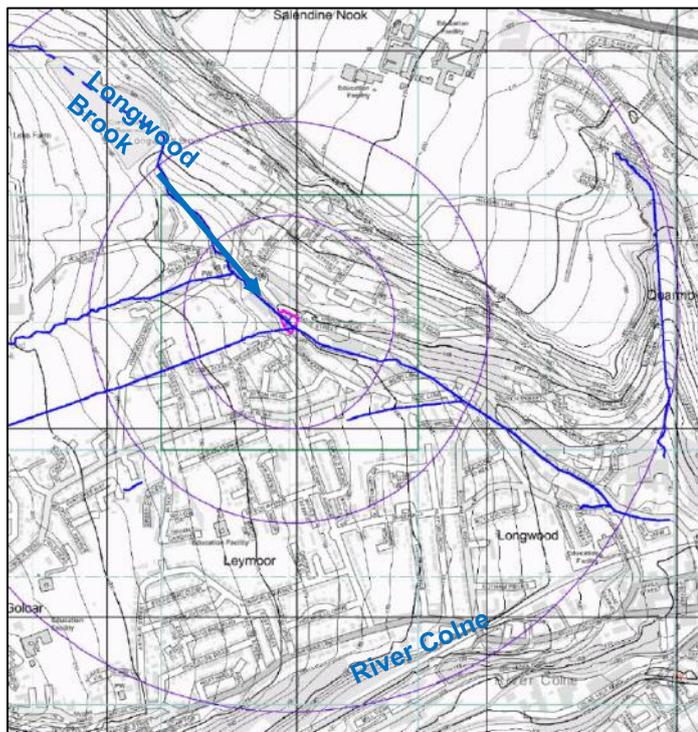

Table 3: Groundwater Classifications		
STRATA	Aquifer / Soil Leachability EA Classification	Comments
Made Ground:	Not classified.	Of very limited extent and thickness on site, but possible present to the south-east. Possible fill to Longwood Brook culvert.
Superficial Soils	Not Present	Not applicable
Huddersfield White Rock Sandstone	Secondary Aquifer - A	Low to medium permeability. Can provide modest amounts of water, but the nature of the deposit limits their use. They support water supplies at a local rather than strategic scale but may remain important for the provision of base load to rivers, wetlands and lakes.

3.6 SITE HYDROLOGY

Table 4 : Surface Water Classifications		
SURFACE WATER FEATURE	Location	Comments
GQA Classified River	None recorded within 250m.	The River Colne is designated as being of River Quality C.

Table 4 : Surface Water Classifications		
SURFACE WATER FEATURE	Location	Comments
Unclassified Watercourse(s), Canals, Ponds and Lakes	Numerous surface water courses within 500m – see Figure below.	The closest watercourse is the Longwood Brook, which has been controlled, initially by Huddersfield Waterworks during the establishment of the Parkwood Mills infrastructure. The current position of the Longwood Brook, in relation to the site is uncertain but probably in culvert.
Flooding from Rivers and the Sea	The site does not fall within a designated Flood Zone II or III.	Given the site and immediate off-site topography it is considered that flooding from adjacent watercourses is very unlikely.
Groundwater Flooding Susceptibility	On site	BGS report a limited potential for groundwater flooding to occur. - Negligible in reality.
RAINFALL (Average)	Measurement	Comment
Annual	5,261 mm	Based on closest 'station average' records at Leeds – Bradford Airport.
Precipitation, March	333 mm	
Precipitation, December	517 mm	

Local Surface Water Network

3.7 RADON ASSESSMENT

The UK Health Security Agency (UKHSA) has published reports containing radon Affected Area maps for the whole of the United Kingdom. Reference to the relevant map shows that this site lies within an area of low radon potential, where a radon potential less than 1% can be expected.

This means that less than 1% of dwellings have the chance of having a radon level that is at or above the radon action level of 200Bq/m³.

Notwithstanding this, it is possible to obtain site specific radon potential risks for particular residence post codes.

Reference is made to BRE Digest, BR211 (2015) Radon: Guidance on protective measures for new buildings.

3.8 SITE ECOLOGY, ENVIRONMENT AND SENSITIVE SITE USE

As expected, given its urban and industrial context, the site does not lie within a Nitrate Vulnerable Zone.

There are no Sites of Special Scientific Interest (SSSI) located within 1km of the site.

PS Geotech is not aware of an ecological or arboricultural survey having been undertaken at the site, but there are areas of significant mature trees, which need to be covered by an arboriculturist report.

There is an area of adopted/unadopted greenbelt, some 100m to the northwest of the site. This is not expected to have any influence on the site development.

3.9 GROUND STABILITY

The Ground Stability section of the EnviroSearch database search has been reviewed with respect to the published geology and provides general information on the potential for ground instability on-site and are discussed below.

Mine Workings and Mine Instability

The property is not located within a surface area that could be affected by past or present underground mining.

Compressible Ground and Ground Dissolution Hazards

No hazard is anticipated at this property based on the available information.

3.10 ASBESTOS

The degree of asbestos risk cannot be assessed on the basis of the available information. Any Made Ground that has accumulated on site, from whatever source, could contain any of the common asbestos types.

It will be recommended that all soil samples collected at a Stage 2 Geoenvironmental study sent for laboratory testing are screened for potential asbestos fibres.

4.0 INDUSTRIAL CONTEXT

4.1 RECENT SITE HISTORY

A description of the recent site history of the Parkwood 6 & 7 unit has been included at Section 2.2. This has shown that from the mid-19th century, the Parkwood area, within the Longwood Brook catchment area has been developed as a major woollen textile manufacturing centre. While the industrial focus on this area declined, with the general British woollen textile industry decline during the late 20th century, the region has more recently benefitted from a local push to preserve and re-purpose the former industrial buildings so that the area is now termed as 'residential and light commercial'.

4.2 LANDFILL AND WASTE

The following information relating to Landfill and Waste has been obtained from the Landmark Information Group EnviroCheck Report (attached in **Appendix B**):

- a BGS recorded landfill site is located to the south-eastern of the site at the southern boundary of the previous PS Geotech Phase 1 Study (*ibid*) below the junction with Stoney Lane.
- based on the recorded site history, only nominal thicknesses of Made Ground deposits are expected over most of the site area;
- during the active woollen milling activities at the Unit 6 & 7 site there will have been waste collection and disposal issues. It is not known where these were located, but probably in the grounds to the north-east.

4.3 STATUTORY REQUIREMENTS / AUTHORISATIONS

Table 5: Statutory Issues		
Reference	Location	Comments
Local Authority Pollution Prevention and Controls	Decorative Panels Components Ltd c. 150m south-east (down-stream) of site	Manufacture of timber and wood-based products
Local Authority Integrated Pollution Prevention and Control	None recorded within c.500m.	~
Prosecutions Relating to Authorised Processes	None significant within c.250m.	~
Contemporary Trade Entries	None recorded within c.250m.	~
Fuel Station Entries	None recorded within c.250m.	~

In 19th-century Yorkshire, particularly in industrial centres like Leeds, Bradford, and Huddersfield, the wool treatment industry (including scouring, fulling, dyeing, and finishing) used a range of chemicals and substances.

For the most part the initial treatment was cleaning and de-greasing, which mainly involved alkaline products. Dyeing and finishing usually involved the use of heavy metals. It is therefore possible for a wide range of contamination residues to be present within the site curtilage.

5.0 CONCEPTUAL SITE MODEL (CSM)

The Conceptual Site Model (CSM) is one of the primary planning tools that can be used to support the decision-making process of managing contaminated land and groundwater on any given site, and allows a better understanding of what needs to be done to achieve risk management, and informs the decision making process that allows appropriate remediation techniques, if required, to be chosen. This can be done by undertaking a source-pathway-receptor analysis of the site.

Table 6 Conceptual Site Model Programme

Sources (S)		Pathways (P)		Receptors (R)	
S1	There are cumulative risks relating to the past use of Parkwood 6 & 7 woollen mills associated with its former uses. Structurally, asbestos has to be a significant risk. Alkaline and heavy metals associated with the wool treatment industries. Uncertainties regarding buried utilities/services. Asbestos could be present in Made Ground.	P1	Ingestion.	R1	Human health (end users and construction workers).
		P2	Inhalation.	R2	Groundwater below the site is anticipated at depth and is designated as a Secondary Aquifer A.
		P3	Dermal Contact.		
S2	There is a residual risk from potential soil gas migration through Made Ground and sub-soils from buried services and filled former mill ponds.	P4	Migration through existing services and shallow soils.	R3	Building materials.
		P5	Direct contact with building materials.	R4	Adjacent sites.
		P6	Surface run off.	R5	Flora and fauna.

A plan and cross-sectional representation of the CSM has been produced for this site and is presented in **Appendix C**, which sets out the critical pollutant linkages of concern for this site, with regard to contamination as highlighted above.

5.1 GEOTECHNICAL CONSIDERATIONS

The following potential geotechnical issues and hazards have been identified for this site, and these issues should be considered before future development of the site is to take place. It is understood that for the most part

- Made Ground may be present across the site. Made Ground may be associated with general materials accumulating to shallow depth but of no great concern.
- buried trenches may cross the site containing buried services.
- it is known that the Longwood Brook passes beneath the site through culvert. While the position of culvert is documented, this has not been proven;
- several trees with preservation orders are present within the site. These present a development constraint in their own case, but also as a potential constraint on foundation design as a result of potential soil desiccation.

To determine the ground conditions with more certainty, it is recommended that consideration is given to undertaking a programme of intrusive works with associated insitu geotechnical and laboratory classification testing.

The information reviewed indicates that the site can be considered to be located within a **LOW** geotechnical risk setting

5.2 SOURCES OF CONTAMINATION

Soils – Human Health

The historical OS maps, the Landmark Information Group Envirocheck Report and other environmental information have revealed that Parkwood Mill Units 6 & 7 were developed during the second half of the 19th century.

During the mid-19th century to late 20th century, while Parkwood Mills were in their prime, the site remained as originally set out with little structural change and no apparent change within the grounds that surround the mill structures.

The works undertaken by Huddersfield Waterworks during the mid-19th century included the channelling of the Longwood Brook headwaters into the valley through mill races, leats and goits. The path of the downstream outlet of the brook probably passes beneath the site.

Considering the above, potential on-site contaminative issues have been identified for this site, as listed below.

- Limited areas of Made Ground present beneath the ground surface;
- spillages from former tanks on site;
- encroachment of mill pond to the south-east;
- culverted Longwood Brook.

The information reviewed indicates that the site can be considered to be located within a **MEDIUM** ground contamination risk setting for Human Health and the environment.

Groundwater / Leachate – Controlled Waters

The following issues have been taken into consideration when assessing the risks towards groundwater / controlled waters;

- groundwater below the site has been classified as a Secondary Aquifer - A and is anticipated to be present at depth within the solid geology (Carboniferous strata);
- there are no Source Protection Zones recorded within 1km from the boundaries of the site;
- there is are no downstream Water Abstractions recorded within 100m from the boundaries of the site.

The information reviewed indicates that the site can be considered to be located within a **LOW to NEGLIGIBLE** ground contamination risk setting for Controlled Waters.

6.0 RECOMMENDATIONS FOR PHASE 2 GROUND INVESTIGATIONS

It is recommended that consideration is given to targeted Phase 2: Ground Investigation Works.

This investigation should be completed prior to commencing with any future development works and could include the following or similar investigation works:

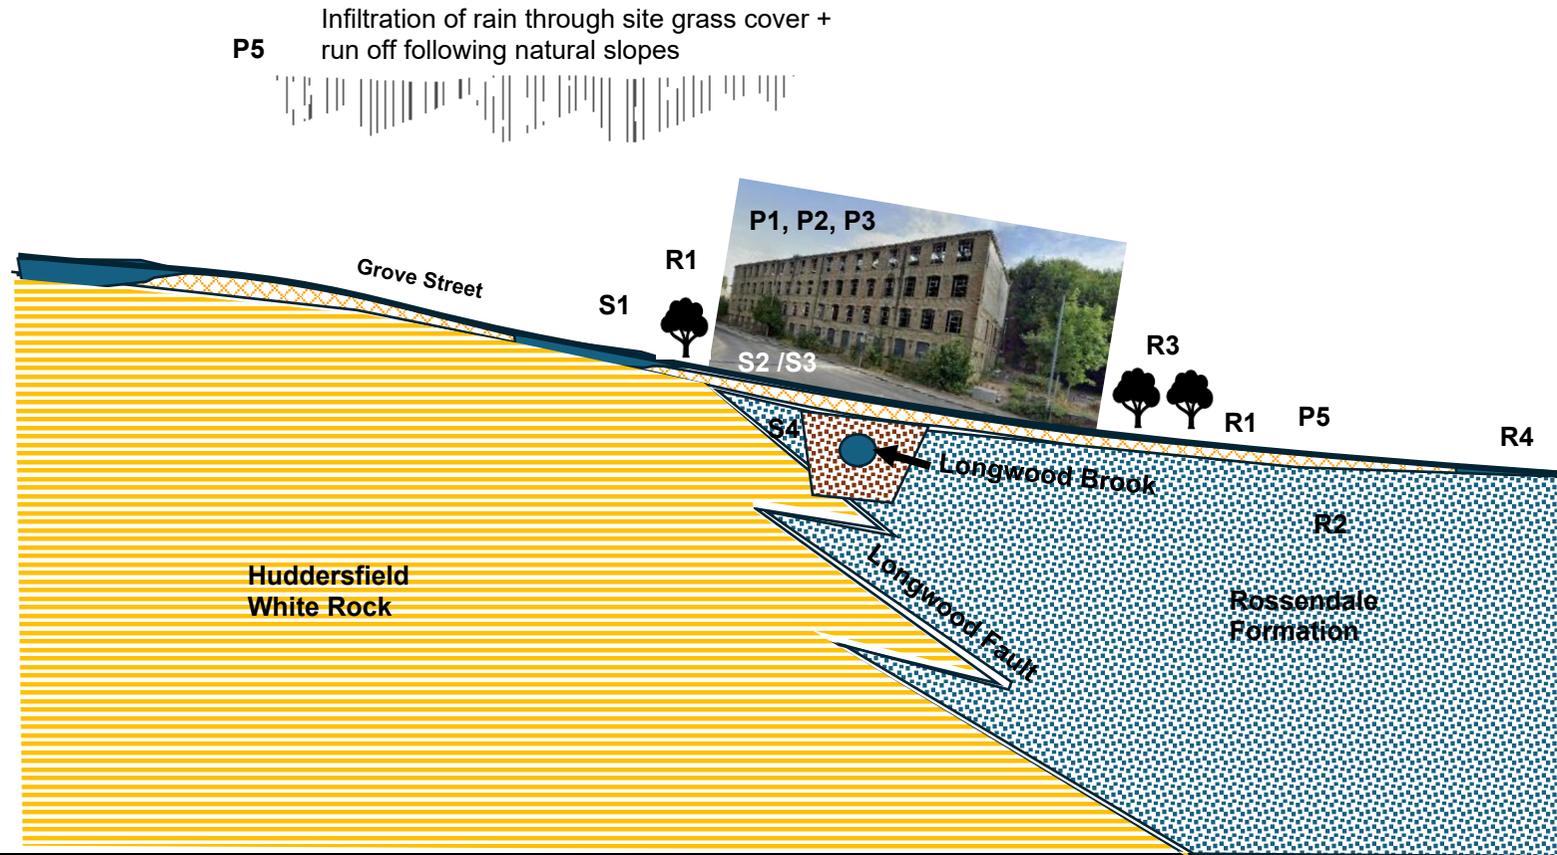

- conventional dynamic probe boreholes to collect samples of shallow Made Ground and weathered solid strata;
- use of the dynamic probes to install groundwater/ground gas monitoring and the establishment of a ground gas monitoring period;
- confirmation of the Longwood Brook culvert and establishment of areas of responsibility.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Ove Arup Copyright Notice

The Mining Instability data was obtained on licence from Ove Arup & Partners Limited (for further information, contact mining.review@arup.com). No reproduction or further use of such Data is to be made without the prior written consent of Ove Arup & Partners Limited. The supplied Mining Instability data is derived from publicly available records and other third party sources and neither Ove Arup & Partners nor Landmark warrant the accuracy or completeness of such information or data.

Stantec Copyright Notice

The cavity data presented has been extracted from the PBA (now Stantec UK Ltd) enhanced version of the original DEFRA national cavity databases. Stantec UK Ltd retain the copyright & intellectual property rights in the data. Whilst all reasonable efforts are made to check that the information contained in the cavity databases is accurate we do not warrant that the data is complete or error free. The information is based upon our own researches and those collated from a number of external sources and is continually being augmented and updated by Stantec UK Ltd. In no event shall Stantec UK Ltd or Landmark be liable for any loss or damage including, without limitation, indirect or consequential loss or damage arising from the use of this data.

Radon Potential dataset Copyright Notice

Information supplied from a joint dataset compiled by The British Geological Survey and Public Health England. The probability result is only valid for properties above ground. All basement and cellar areas are considered to be at additional risk from high radon levels. If an underground room such as a cellar or basement makes up part of the living or working accommodation, the property should be tested regardless of Radon Affected Area status.

Yorkshire

Published 1854

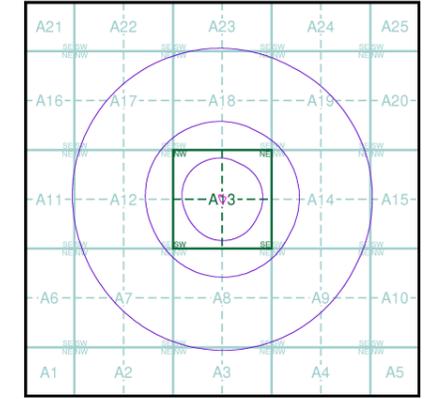

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Huddersfield

Published 1984

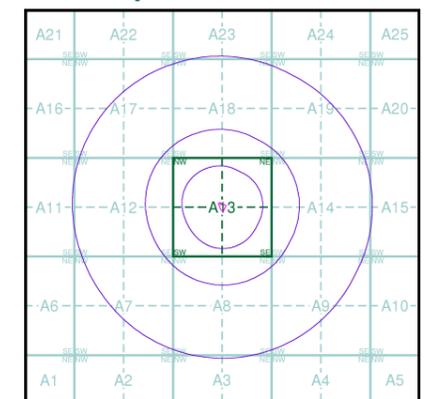

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use. They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 2000

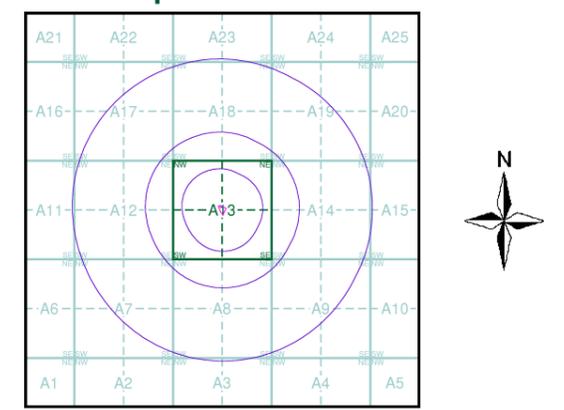

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local
Published 2024
Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).
