Dear Sirs

**Re: Initial Phase 1 Desk Top Study on land adjacent to:
212 Commonsides, Hanging Heaton, Batley**

Introduction

Savile Estate wish to develop the site for residential use. This Phase 1 Desk Top Study is required to determine the risk of contamination associated with past use of the site.

The Site

The Site lies on the North side of Dewsbury and east of Batley town centre. The site is currently used as a motor engineering service and was formally used as a refrigerated food store.

Sources of Information

Information on the above site has been obtained from a Mining Report, a walkover survey of the site and a full Envirocheck Report centred on a site 800m North East of the site.

Past Land Use

Examination of the published Ordnance Survey maps of the area revealed the following:

Map		Features	
Year	Scale	On Site	Off Site
1854	1:10,560	A building occupies the site	The village of Hanging Heaton lies 500m east of the site. There are a number of mills 150m east and 600m south west of the site. A sandstone quarry is shown 200m north west of the site. There is a coal pit 700m north east of the site. Hill top well lies 250m east of the site. Railways/railway cuttings run north to south, 250m west of the site and north to south east, 800m from the site.

Residential • Industrial • Commercial • Retail • Leisure • Education & Health • Rail • Sewerage • Highways • Contaminated Land

1893	1:2,500	-	Soothill colliery occupies a large area 700m north east of the site. Soothill brewery lies 800m, an old quarry 900m and a day hole 800m north east of the site.
1895	1:10,560	Unchanged.	Gas works 350m north and a colliery 800m north east of the site.
1907	1:2,500	-	As 1893.
1908	1:10,560	Unchanged.	Sewage works 350m north west, a quarry 650m west and manure works 800m north east.
1922	1:2,500	-	Soothill quarry is now shown to be disused.
1933	1:2,500	-	Soothill colliery is now shown to be disused
1938	1:10,560	Unchanged.	Housing development south of Hanging Heaton village.
1956	1:2,500	-	Soothill quarry now shown as allotment gardens. 850m north east there are two rag warehouses. Most of Soothill colliery buildings to the south have now gone.
1966	1:2,500	-	Allotments at Soothill quarry are now a housing estate.
1972	1:10,000	Unchanged.	Shows that there is more housing in the area. Soothill Wood quarry is now filled in. Mill buildings expanded 400m north east of the site.
1982	1:10,000	Unchanged.	Industrial units 650m north east of site. Soothill Wood quarry completely filled and the area contoured. Railway running north to south east, 800m from the site is now shown as a dismantled.
1992	1:1,250	-	Dismantled railway 800m from site appears to have been filled.
2000	1:10,000	Unchanged	Warehouse constructed south at the location of Soothill colliery. Allotment gardens 300m south west. Circular gas tanks in gas works 350m north of site now not shown.
2007	1:10,000	Unchanged	As today

From the historic map study, the site appears to have been unchanged from 1854 where the site is shown to be occupied by a building. Off site, the surrounding area is largely industrial (mills and gas works) to the north and west; and residential to the south and east. The gas works 350m north of the site has now been developed into an office park and is likely to have been remediated during construction. In addition, from the walk over survey and contour maps, the works is shown to be some 40m lower than the site and therefore is not considered to pose a risk to the site.

Present Land Use/Walkover Survey/Trees

A walkover survey of the site was carried out by JNP Group on 26th February 2009. The site is currently being used as Thornhill Motors, an engineering motor services carrying out vehicle MOTs, services, repairs etc. The motor service was closed during the survey and therefore access was not gained into the buildings. There are a number of disused derelict buildings on site. The site is bound by Commonsides Road to the north, a dwelling to the east, open

fields to the south and a car garage to the west. The site slopes considerably from south to north (from the fields to the road). The southern third of the site is covered in overgrown grass. The rest of the site is covered by buildings and hard standing. Evidence of contamination included two large barrels of lubricant found on site and a large square metal container, which looked to have been burnt out some time ago, with dark patches on the ground.

Landfill

There are no historic landfill sites within 250m of the site.

350m north is a registered waste transfer site, with an authorised maximum input of 10k tonnes/year of uncontaminated earth and excavation waste. This type of waste is unlikely to create gases and contamination and therefore is low risk.

350m north west is a registered waste treatment/disposal site with an authorised maximum of 10k tonnes/year of car batteries, scrap cars, tyres, waste oil. This type of waste could be highly contaminated, however the distance to site and the quantity of waste reduces the risk of contamination from the waste site.

380m north of the site is a registered landfill site –Batley holder station, licence lapsed in 1981. Type of waste prohibited was construction/ demolition – inert/non-hazardous/excavated natural materials, this type of waste is unlikely to create gases and contamination and therefore risk is low.

380m north west is a vehicle dismantlers – a metal recycling site. Contamination from this recycling site could be in the form of liquid organic contaminants found in degreasers and petroleum products, these could migrate through the surface, soils and ground water. From the walk over survey, the site slopes considerably from south to north, therefore the site is uphill if the metal recycling site, this, along with the distance to site, reduces the risk to low.

Services

These have not been examined as part of this Phase I report. Enquiries should be made to ensure that the site can be fully serviced and that there are no restrictions or easements across the site which would impede the building of the proposed residential development.

Geology

Examination of the published geological map of the area, Sheet 77, approximate grid reference (252,232), indicates the area to be on either Thornhill Rock, part of the middle coal measures or Flockton Thick, a part of the Lower Coal Measures. The site is on a coal crop.

Mining

A mining report for the area has been obtained and this is appended.

The report shows three seams of coal to have been worked at depths of 109m, 186m and 263m. The shallowest being adjacent to the site and the others being subjacent to the site. The report records there are no faults or abnormal features relevant to the property and there are no shafts or adits within 20 m of the property. The report records that the property is not situated within the boundary of a former opencast coal mining site.

The report does highlight there are possible ancient shallow coal mining works within the likely zone of influence on the surface in the vicinity of the property, for which no accurate plans or records exist.

The report concludes that old workings are present but all settlement is likely to have completed long ago. However, recommends undertaking 'all necessary enquiries and investigations prior to the commencement of works'.

Radon

The site is situated in an area in which the British Geological Survey states that between 5 and 10% of homes are above the action level. **Basic Radon** protection measures are necessary in the construction of new dwellings or extensions.

Hydrology/Hydrogeology

The Environmental Agency ground water vulnerability map shows the bedrocks in this area to be minor aquifer, but of variable permeability in terms of ground water abstraction and usage. These can be fractured or potentially fractured rocks which do not have a high primary permeability, or other formations of variable permeability, including consolidated deposits. Although not producing large quantities of water for abstraction, they are important for local supplies and supplying base flows to rivers.

There are no water abstraction licences within 250m of the site. There are two water abstraction licences within 500m of the site. The abstraction licence at 400m north of the site is operated by Crowthers (Dyers) Limited, used for general industrial and the licence has lapsed. The abstraction licence of surface water 400m North West of the site is operated by Cullingworth Summers & Co Ltd.

Pollution Incidents

There have been no pollution incidents in controlled waters within 250m of the site. There are two incidents within 500m of the site. In 1990, a major pollution incident was recorded at Scotia/Batley Beck 300m north west of the site. The pollutant was 'heating oil' and is attributed to an industrial premise. In 1997, a minor pollution incident was recorded at Batley Beck 500m north west of the site. The pollutant was 'chemicals-paints/dyes' from the rear of Frontier Club, the pollutants was noted not to kill any fish.

There have been two substantiated pollution incidents within 500m of the site. Both were significant incidents that impacted the land. In 2001, general biodegradable material was recorded 450m north east of the site. In 2002, commercial waste was recorded 450m north east of the site.

Flood Risk

The site is **not** in an area prone to flooding from rivers or sea.

Sensitive Land Use

The site is within a nitrate vulnerable zone. This would only be applicable to agricultural usage of the site. The proposed end use is not deemed to represent a risk to this feature. The site is not in a green belt; however is directly north and 50m south of an area of adopted green belt.

Site Investigation

No intrusive investigations have been undertaken at this stage.

Summary

The desktop study has highlighted that the site has been unchanged from 1854 where the site is shown to be occupied by a building and the surrounding area being largely industrial to the north and west; and residential to the south and east. The site is currently used as a motor engineering service and was formally used as a refrigerated food store. Evidence of contamination on site included two large barrels of lubricant found on site and a large square

metal container, which looked to have been burnt out some time ago. There are no historic landfill sites within 250m of the site. The coal mining report shows three seams of coal to have been worked at depths of 109m, 186m and 263m. The mining report records there are no faults or abnormal features relevant to the property and there are no shafts or adits within 20 m of the property, but does highlight there are possible ancient shallow coal mining works within the likely zone of influence on the surface in the vicinity of the property, for which no accurate plans or records exist. These possible shallow workings need to be investigated.

UK LEGISLATION ON CONTAMINATED LAND

Part IIA of the Environmental Protection Act, 1990 was introduced on 1 April 2000. It created a new statutory regime for the identification and remediation of land where contamination poses an unacceptable risk to human health and the environment.

Part IIA provides a statutory definition of contaminated land:

“any land which appears to the Local Authority in whose area it is situated to be in such a condition by reason of substances in, on or under the land, that significant harm is being caused, or that there is a significant possibility of significant harm being caused, or that pollution of controlled waters is being or is likely to be caused”.

To determine whether land falls under the Part IIA definition of contaminated land the site should be evaluated in the context of a risk based framework. The assessment of contaminated land is typically a two-phase process which is initially based on a qualitative assessment of the likelihood of complete pollution linkages, with a quantitative element which seeks to determine the degree and the significance of the harm.

Land is only defined as ‘Contaminated Land’ if there is a “significant pollutant linkage” present.

A pollutant linkage must comprise the following:

Source - a contaminant at a concentration capable of causing adverse health or environmental effects.

Receptor - there must be a human or environmental receptor present, which may be at risk of harm or impact from the source.

Pathway - there must be an exposure pathway through which the receptor comes into contact with the contamination source.

QUALITATIVE RISK ASSESSMENT

Source

The historical maps (1854 – present) indicate that the site has remained substantially unchanged, being occupied by a building, currently used as a motor engineering service and formerly a refrigerated food store. Possible sources of contamination from the motor engineering service include lubricating oils (may contain lead, copper, PAHs), antifreeze (may contain ethylene glycol, methanol), solvents (may contain chlorinated hydrocarbons) and paints (may contain lead, zinc, VOCs).

A walkover survey undertaken by JNP Group identified potential contamination sources from barrels of lubricant stored on the ground and a large metal container that had been burnt out, with dark patches around the grass below.

Pathways

Potential contaminant migration pathways considered relevant to the site are:

Human Health – Direct physical contact with near surface soils by the site end users. This may be through ingestion of plants and soils, dermal contact with soils and inhalation of dust.

Pore Water – Vertical and lateral migration of contaminants in near surface soils leaching to underlying groundwater and surface water.

Receptors

The receptors considered to be potentially impacted by contamination are as follows:-

Human Health

A residential development is proposed to be built on the site. Therefore occupants and construction workers are a potential receptor. Children of between 6 months and 6 years have been identified as the critically sensitive receptor, in accordance with the Contaminated Land Exposure Assessment (CLEA) Guidelines (DEFRA & ER 2002). Human Health receptors will be prevented from contacting near surface soils by the presence of metallised surfaces such as paths and drives, buildings and the provision of clean topsoil to landscaped areas, should contaminants be found. Construction workers may be protected by suitable protective clothing.

Risk

There is a source of contamination on the site from past land usage as a refrigerated food store and present use as a motor engineering service. To establish the level of risk, a full suite of contamination testing of the soils is required to show that contamination does not exist, or prove otherwise. If contamination is found, then the source should be removed or the pathway be cut, to ensure that the linkage to the receptor is broken.

Ground Water

The surface water run off from the site in to watercourses and underlying ground water are potential receptors, from onsite contaminants.

Risk

To establish the level of risk, a full suite of contamination testing of the soils is required to show that contamination does not exist, or prove otherwise. If contamination is found, then the source should be removed or the pathway be cut, to ensure that the linkage to the receptor is broken.

Recommendations

1. Trial pits will be required in order to take a series of soil samples for contamination testing and to establish geotechnical information for the design of foundations.
2. Soil samples should undergo a full suite of contamination testing and in particular looking for possible contaminants from motor engineering service include lubricating oils (may contain lead, copper, PAHs), antifreeze (may contain ethylene glycol, methanol), solvents (may contain chlorinated hydrocarbons) and paints (may contain lead, zinc, VOCs).
3. The proposed use of the site is residential and therefore shallow coal workings need to be investigated. A series of boreholes should be undertaken to search for shallow coal workings.

4. The site is situated in an area in which the British Geological Survey states that between 5 and 10% of homes are above the action level. **Basic Radon** protection measures are necessary in the construction of new dwellings or extensions.

Conclusions

The Phase 1 report has highlighted possible contamination sources due to the site currently being used as a motor engineering service and formally as a refrigerated food store. A full suite of contamination tests should be carried out to prove that contaminants do not exist, or prove otherwise. If contamination is found, then the source should be removed or the pathway cut, to ensure that the linkage to the receptor is broken.

Boreholes are required to prove there are no shallow coal workings and along with the trial pits, will provide geotechnical information for the design of foundations.

The site is situated in an area in which the British Geological Survey states that between 5 and 10% of homes are above the action level. **Basic Radon** protection measures are necessary in the construction of new dwellings or extensions.

This phase 1 report has not highlighted any factor that would prevent the development of the site for residential use.

Yours faithfully

Sarah Tang

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.

For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

	Groundwater Vulnerability Geological Classification: Minor Aquifer (Variably permeable) - These can be fractured or potentially fractured rocks, which do not have a high primary permeability, or other formations of variable permeability including unconsolidated deposits. Although not producing large quantities of water for abstraction, they are important for local supplies and in supplying base flow to rivers Soil Classification: Soils of High Leaching Potential (U) - Soil information for restored mineral workings and urban areas is based on fewer observations than elsewhere. A worst case vulnerability classification (H) assumed, until proved otherwise Map Sheet: Sheet 11 South Pennines Scale: 1:100,000	A13SW (W)	0	1	425597 423823
	Groundwater Vulnerability Geological Classification: Minor Aquifer (Variably permeable) - These can be fractured or potentially fractured rocks, which do not have a high primary permeability, or other formations of variable permeability including unconsolidated deposits. Although not producing large quantities of water for abstraction, they are important for local supplies and in supplying base flow to rivers Soil Classification: Soils of Low Leaching Potential - Soils in which pollutants are unlikely to penetrate the soil layer because water movement is largely horizontal or they have large ability to attenuate diffuse pollutants. Lateral flow from these soils contribute to groundwater recharge elsewhere in the catchment Map Sheet: Sheet 11 South Pennines Scale: 1:100,000	A13SW (W)	0	1	425597 423823
