

Climate Change Statement

The previous door did not fit properly as it was wood, and expanded and contracted with the seasons, and did not seal properly.

Consequently this caused use of additional resources in both winter and summer, in winter, it was necessary to provide further heating to the property, and in summer it was necessary to provide further cooling to the property.

The fitting of the new door has alleviated this problem to a certain extent, thus reducing the amount of fossil fuels required for heating.
