

Spaciotempo®

Specification Sheet

Thermo Roofs

Made from a PVC coated fabric and unless otherwise specified comes in standard white. Traffic White RAL 9016.

Our thermo roofs consist of two layers of this PVC coated fabric that is inflated using a self-regulating roof compressor. The compressor distributes air between roof skins and once it has reached the required 'fill-level' it will switch itself off. The pump will only reactivate if there is a sudden loss of pressure within the inflated envelope which can be caused by a 'foreign-body' on the roof, power cut or a tear of the material itself.

The fabric that we use offers the highest levels of quality and reliability for use in flexible tensile fabric structures & mobile constructions. Woven as a yarn (PES/glass) and coated (PVC/PTFE/PU) in various widths it is a material that is widely used around the World. This product offers long-lasting protection against environmental impacts, for both people and goods.
