

**REDACTED**

The installation will be performed by Motability's chosen installer. In order to minimise the visual impact we requested the installer do the following:

1. Run the mains feed to the charger externally alongside the existing mains supply cabling and using visually similar materials. Cabling on the exterior of the property would be Black 6mm 3 core SWA cabling approximately 14-16mm outside diameter, where possible clipped alongside the existing electricity mains supply cables and the clips fastened into mortar where possible.
2. Install a small charger unit (Ohme ePod) in a dark material, with one Type 2 charging port suitable for an untethered cable.
3. Install the charger at a low height and near the neighbouring existing fence.
4. Fittings to be attached into mortar where possible

For details of the external installation, please see photographs attached to the initial Householder Planning Permission submission. For details of the Ohme ePod please see the product manual attached to the initial Householder Planning Permission submission
