<p>The replacement site is needed to improve coverage in the area, both for EE and 3UK. The existing site is problematic, being too low down to provide good quality coverage (except very close to the site). This has led to extensive indoor blackspots. Without it, the service would be considerably worse. The replacement site will provide superior 4G and 5G service to the local community. Due to the industrial buildings on that side of the road, the site will not be particularly intrusive.</p> <p>There are also many low income families in the area who may struggle to afford home broadband, or not have access to it at all. This makes high quality mobile data particularly important.</p>
