1.0 Introduction

Geo^2 Limited were commissioned by ADP Architects to conduct a Phase 1 Preliminary Risk Assessment of a site located at

Site off Hightown Lane,
Holmfirth, HD9 3HU

The site is approximately 0.04 hectares in area and located at grid reference 414180, 408320.

The study was undertaken prior to proposed development of the site for residential use. Existing and proposed site plans are included in Appendix A.

1.1 Scope of Works

The Preliminary Risk Assessment, consisting of desk study and site walkover, was conducted in order to assess the potential for contaminant sources to be present on site, resulting from the past use of the site and current land use.

The desk study was also undertaken to identify possible sensitive environmental receptors that may be at risk from sources, if present on site, within the locality of the site.

The scope of the Preliminary Risk Assessment has given consideration to guidance on Land Contamination: Risk Management pages of the GOV.UK web pages, the relevant requirements of the National Planning Policy Framework (NPPF) (as revised 2023) (paragraphs 180 & 189-191) and the Planning Practice Guidance (Land Affected by Contamination).

2.0 Description of the Site and Surroundings

2.1 Site Description

The site is located within the town of Holmfirth, West Yorkshire. Figures 1 and 2 in Appendix A show the location of the site.

The site is currently the rear garden of Carr Mount house which faces Carr House Road to the northwest.

The area shown within the red site boundary on Figure A below, will be referred to throughout this document as 'the site'.

The site has one ingress/egress point via a pedestrian gate and steps from Hightown Lane on the eastern boundary, the west side of the site also joins to access via the main house.

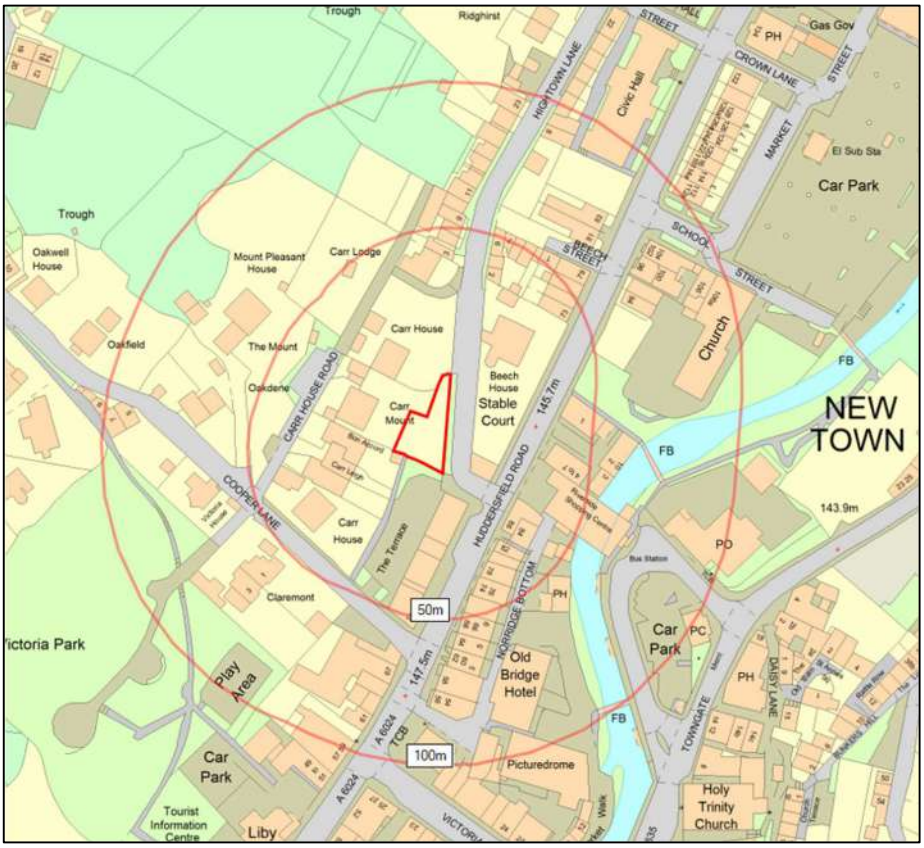

Figure A: Site Location Plan. Red is approximate site boundary and pink are 50m and 100m buffers. Extract from Envirocheck report (Appendix B).

2.2 Site Walkover

A site walkover was undertaken on 11th September 2024, with a photographic survey (Images 1-12) included in Appendix B. The site walkover findings are detailed below.

The site was observed to be sloping down to the east. A retaining wall is present along the eastern site boundary, with the adjacent roadway approximately 3m below the site level (Images 1/10).

The site was partially covered in trees and vegetation to the east. A stone pathway and steps lead from the ingress/egress point on the northeast site boundary to the current Carr Mount rear gardens (Images 2/3/4).

The western site boundary joins to the Carr Mount gardens (Image 5/9) with another access point at the front of the house onto Carr House Rd (Images 7/8). These gardens are stepped, separated by low walls with stone stepped access between the levels.

The southeast area of the site is covered with a gravel (Images 4/6/12).

No visual or olfactory evidence of contamination was observed during the site walkover, and no infrastructure indicative of potential contaminative sources.

2.3 Site Surroundings

The site is located within the town of Holmfirth.

The surrounding land use is dominated by residential land use, with the River Holme flowing north, located 52m from the eastern site boundary.

3.0 Desk Study

3.1 Desk Study Data

Information regarding the environmental setting of the site was obtained from the Envirocheck report, which collated information from a variety of sources. A copy of the Envirocheck report is presented in Appendix C.

Where indicated in Table 1 below, the data from the Envirocheck report has been supplemented with additional information obtained from freely available online data.

Site Geology	British Geological Survey (BGS) data indicates bedrock consists of mudstone and siltstone of the Marsden Formation. There are no superficial deposits available for this location. A group of BGS recorded boreholes are recorded 170m northeast of the site, advanced in 1967. The general trend recorded sandy clay with sandstone boulders to 6m bgl, underlain by very stiff brown sandy clay with sandstone boulders to 6.7m bgl. The Envirocheck report shows the site has the following risk ratings associated with these ground stability hazards: • Collapsible ground stability – very low risk. • Compressible ground stability – no hazard. • Ground dissolution – very low risk. • Landslide ground stability hazard – very low risk. • Running sands stability hazard – no hazard. • Shrinking or swelling clay stability hazard – no hazard.
Mining	There are 4no BGS Recorded Mineral Sites within 500m of the site, with the closest located 305m north at Underhill where sandstone was quarried historically. A review of the Coal Authority online interactive mapping indicates that while the site is located within a coal mining reporting area, the site is not located within a Development High Risk Area (DHRA) and the nearest recorded mine shafts, coal outcrops and probable shallow coal mine workings are all located >1.5km northeast. Therefore, the risk to the proposed development from shallow coal mining is considered to be Low.
Radon	The site is located within an intermediate probability radon area (3 to 5% of homes are estimated to be at or above the Action Level). Basic radon protective measures are necessary in the construction of new dwellings or extensions.

Site Hydrogeology	The bedrock is classified as a Secondary Aquifer A – Permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. The site is not located within a Source Protection Zone (SPZ). The closest groundwater water abstraction point is located 268m northeast for general industrial use. The groundwater beneath the site in the combined secondary bedrock aquifer has been classed as high vulnerability.
Site Hydrology	The nearest surface water feature is the River Holme located 52m southeast of the site, flowing north. River Quality B The closest surface water abstraction point is located 265m northeast for general industrial use. There are 8no discharge consents within 500m of the site. The closest being 81m southeast, concerning sewage discharges.
Waste and Infilled Land	There are 3no historical landfills within 1km of the site. The closest historical landfill is located 160m northeast of the site at Holmfirth Holder Station, containing construction/demolition, inert/non-combustible, poisonous, noxious and polluting wastes. This landfill closed in 1977. There are no potentially infilled land (non-water) sites within 300m of the site. There are 2no potentially infilled land (water) sites located within 150m of the site, likely associated with infilled ponds dating from the 1890s. The closest being 99m northeast.
Unexploded Ordnance (UXO)	A review of Zetica online risk mapping for the area indicates the site is located in a Low-risk area with respect to UXO.

Table 1. Environmental Assessment of the Site.

4.0 Site History

Details regarding the development of the site, its immediate surroundings and potentially contaminative land uses were obtained from a review of historical maps.

Copies of the maps are provided in Appendix C and a detailed summary provided in Table 2 below. All distances given are approximate and are relative to the site, unless otherwise stated.

Date	On-Site	Off-Site	Potential Contamination
1854 – 1906	Earliest available mapping shows the site is developed as a garden to a residential property (Carr Mount) which is located to the northwest. High Town Lane is already established along the eastern boundary by 1854 mapping.	Holmfirth town is established surrounding the site by 1854 mapping, with agricultural land use dominant from 100m west and northwest. The site is located within a residential area, with the River Holme located approx. 50m east. Local industrial land use includes Albert (woollen) Mill and gasometer circa 160m northeast and a Gas Works 150m east. Wood Quarry is mapped 300m north in 1891, becomes disused by 1931.	Potential for made ground soils associated with the construction of the adjacent residential property and roadway
1931	Construction of pathway through the site to Hightown Lane on the eastern boundary by 1931, which remains today.	Gas works is no longer present by 1931. A second gasometer/gasholder is mapped by 1964 adjacent to Albert Mill, located around 170m northeast of the site. This is demolished by 1988 and a car park established.	N / A
1964 – 2024	No significant changes.	Historical gasworks now labelled as car park by 1964. A second gasometer/gasholder can be seen by 1964, located around 170m northeast of the site. By 1985 the second gas holder has been demolished and repurposed as a carpark. The surrounding area continues to redevelop from the 1980s, with new housing constructed from 150m west and Albert Mill and associated gasholder station redeveloped from 150m northeast	N / A

Table 2. Detailed Summary Review of Historical Mapping

5.0 Preliminary Risk Assessment

5.1 Source – Pathway – Receptor

UK legislation and guidance on assessing potentially contaminated land recommends the use of a risk assessment process based on a review of source/pathway/receptor relationships for various environmental media. The first stage of any risk assessment is to identify, using the desk study data and site information, the presence and extent of any hazard at the site, theoretical or demonstrable.

A key component of the overall risk assessment process is identification of "significant contaminant linkages" between contaminants and receptors. This can be accomplished through development of a site-specific conceptual model in which the potential contaminants, pathways and receptors identified on-site are described.

Each element can be defined as follows:

- **Contaminant source:** A substance either on or under the land and which has the potential to cause harm or pollution to human or environmental receptors.
- **Pathway:** A route or means by which a receptor can be exposed to or affected by a source.
- **Receptor:** A living organism or an ecological system, or controlled water, or property including buildings, crops and livestock.

The presence of all three of the above elements identifies a contamination linkage and a potentially unacceptable risk. To ensure that any risk present to, or, from the site can be appropriately managed each of these contamination linkages will be targeted by the investigation.

5.2 Hazard Identification

5.2.1 Potential On-Site Sources

Given the history of the site as a garden and that is has remained relatively unchanged throughout time, there are no potential on-site sources of contamination that can be identified as a hazard.

Anthropogenic material such as stone may exist within shallow soils associated with the construction of the adjacent Carr Mount house.

5.2.2 Potential Off-Site Sources

No significant potential off-site sources of contamination have been identified within close proximity to the site.

Potential ground gas sources include a historic landfill 160m northeast and infilled land (water) within 150m of the site. However, these were completed in 1977 and the 1890s respectively, with

these potential ground gas sources therefore considered to no longer be sources of noxious ground gases.

5.3 Initial Conceptual Site Model

Contamination linkages arise as a result of the interconnection of the contaminant source, contamination pathways and potential receptors. These contamination linkages are used to design the site investigation (if required), guiding the type of investigation, location of exploratory boreholes and the required sample analysis.

5.4 Risk Estimation

The objective of the qualitative risk assessment is to determine the significance of the risk, if any, which may occur as a result of the creation of pollutant linkages, which connect a potential receptor to an identified potential contaminant source at the site.

The perceived risk is based on a consideration of both the likelihood of an event (probability) occurring, and the severity of the potential consequence. Classification of these two factors is detailed in Appendix D.

5.5 Qualitative Risk Assessment

A qualitative risk assessment is undertaken, detailed in Table 3 on the following page, in line with guidance provided in CIRIA's Contaminated Land Risk Assessment: a guide to good practice CIRIA C552, 2001. The purpose of this assessment is to determine the relative significance of the identified contamination linkages by assessing the probability of an impact occurring and by assessing the perceived severity of an impact to a receptor.

Those linkages considered of low risk or less on the basis of the available site data will not be considered any further in this assessment. Linkages considered to be more significant are identified as presenting potentially unacceptable risk to the identified receptor. In these instances, further works may be considered necessary.

Source(s)	Pathway(s)	Receptor(s)	Comments	Risk	Requires Investigation
Potential made ground including anthropogenic material such as stone may exist within shallow soils associated with the construction of the adjacent Carr Mount house	Leaching to groundwater, lateral and vertical flow, followed by migration within the aquifer.	Surface water - River Holme located 52m east of the site, flowing north. River Quality B Bedrock Secondary Aquifer A labelled as high vulnerability. No SPZ or potable abstraction points within 1km.	No sources of contamination have been identified within the existing residential garden use of the site that could present a risk to controlled waters	**Low** (Unlikely x Medium)	No
	Exposure to harmful vapours and hazardous ground gases	Proposed residential site end users in enclosed spaces. (human health)	Taking into account the length of time since the former gas holder and ponds were infilled, no significant sources of ground gases are considered to be present. Legacy gases are also considered likely to flow towards the River Holme to the east.	**Low** (Unlikely x Medium)	
	Direct contact, inhalation and ingestion	Proposed residential site end users in garden areas (human health)	No sources of contamination have been identified within the existing residential garden use of the site that could present a risk to residential end users	**Low** (Unlikely x Medium)	

Table 3. Summary of Qualitative Risk Assessment

6.0 Conclusions and Recommendations

6.1 Conclusions

A Phase 1 Preliminary Risk Assessment for a Site off Hightown Lane, located at Holmfirth, HD9 3HU was undertaken, prior to proposed development of the site for residential use.

The purpose of the assessment was to evaluate the potential for risk to be posed to human health and controlled waters from historical and current use of the site.

Earliest historical mapping shows the site has been a garden for the adjacent Carr Mount house built prior to 1854, with a stone pathway throughout.

While the surrounding area is dominated by residential land use, some industrial land use change has been seen over time with gas holding/gasometers being located between 160-170m northeast of the site, all of which were demolished and redeveloped by 2000. Furthermore, a gas works facility was functional through the early 1900s, becoming a car park by 1931. Wood Quarry was also noted 300m north, being disused by 1931.

The site is underlain by a Secondary A Aquifer, labelled as highly vulnerable. There are no superficial deposits data for the site. The site is located within an intermediate radon area.

Taking into account the historical and current use of the site as a residential rear garden, Geo^2 consider the site presents a **Low** risk to proposed residents and controlled waters.

6.2 Recommendations

The following measures are recommended to address the identified risks:

- Construction workers should be provided with appropriate PPE and welfare facilities if coming into contact with shallow soils during proposed works.
- Basic radon protective measures are necessary in the construction of new dwellings or extensions.

7.0 Report Limitations

This Report was prepared by Geo^2 for the sole and exclusive use of the Client and for the specific purpose for which Geo^2 was instructed. Unless explicitly agreed otherwise, in writing, this Report has been prepared under Geo^2's Standard Terms and Conditions.

Geo^2 does not intend, without its written consent through a formal letter of reliance or warranty, for this Report to be disseminated to any party other than the named Client or to be used or relied upon by any party other than the named Client. Use of the Report by any other party is unauthorised and such use is at the sole risk of the user. Any party using or relying upon this Report, other than the Client, agrees by virtue of its use to indemnify and hold harmless Geo^2 from and against all claims, losses and damages (of whatsoever nature and howsoever or whensoever arising), arising out of or resulting from the performance of the work by Geo^2.

The recommendations contained within this Report represent Geo^2's professional opinions, based upon the information detailed within the Report, exercising the reasonable skill and care to be expected of a professional consultant holding itself out as having the competence, experience, and resources necessary for the purpose of carrying out similar work in scope and character to the services performed. The Report needs to be considered in the light of the proposal and associated limitations of scope. The Report needs to be read and considered in full and isolated sections cannot be used without full reference to other elements of the Report and any previous works referenced within the Report.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geo2™

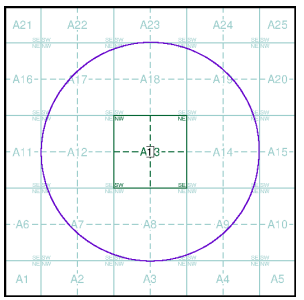

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

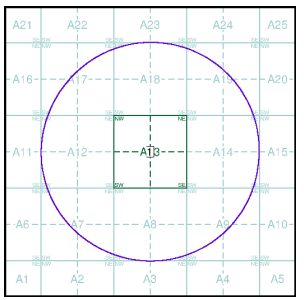

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

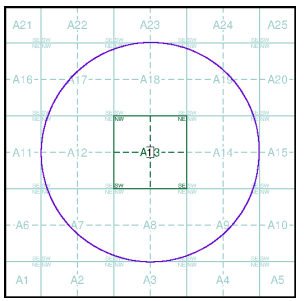

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

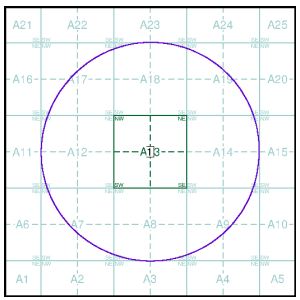

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Groundwater Vulnerability

General

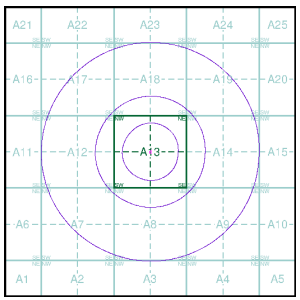

Specified Site | Specified Buffer(s) | Bearing Reference Point
Slice | Map ID

Agency and Hydrological

Bedrock Aquifers	Superficial Aquifers
High Vulnerability, Principal Aquifer	High Vulnerability, Principal Aquifer
High Vulnerability, Secondary Aquifer	High Vulnerability, Secondary Aquifer
Medium Vulnerability, Principal Aquifer	Medium Vulnerability, Principal Aquifer
Medium Vulnerability, Secondary Aquifer	Medium Vulnerability, Secondary Aquifer
Low Vulnerability, Principal Aquifer	Low Vulnerability, Principal Aquifer
Low Vulnerability, Secondary Aquifer	Low Vulnerability, Secondary Aquifer

Unproductive Aquifer
Soluble Rock

Sensitive Land Uses

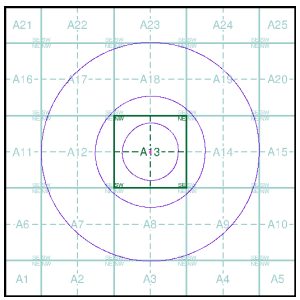

General

Specified Site | Specified Buffer(s) | Bearing Reference Point
Slice | Map ID

Sensitive Land Uses

- Ancient Woodland
- Area of Adopted Green Belt
- Area of Unadopted Green Belt
- Area of Outstanding Natural Beauty
- Environmentally Sensitive Area
- Forest Park
- Local Nature Reserve
- Marine Nature Reserve
- National Nature Reserve
- National Park
- Nitrate Sensitive Area
- Nitrate Vulnerable Zone
- Ramsar Site
- Site of Special Scientific Interest
- Special Area of Conservation
- Special Protection Area
- World Heritage Sites
